~~~~~~

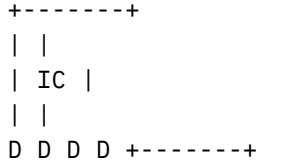
I just got the following. I CANNOT VERIFY THIS. However I do know the aircraft (hold F down then LOW) toggle does work.

From: LAIRDPG@lub001.lamar.edu
Subject: Re: TH28A mods? Anyone?

Date: Sun, 16 Aug 92 19:59:26 PDT

TH28A Mods:

1) Remove the 4 screws holding the radio together.
2) With your finger in the battery bay, separate the two parts.
3) The inside of the keypad case has a copper RF shield. Move this shield out of the way by removing the 2 screws and bending it up and away from the PC board. (There may be double sticky tape holding the shield to the IC.) Under the shield you will find a large IC surrounded by an array of diodes, as follows:



~~~~~~

1 1 1 1
5 4 3 2

D D D D
1 1 9 8
1 0

(The diode numbers are read vertically.)

NOTE: Diodes D15 & D14 are NOT present in the American version.

4) Remove diodes D8 and D10.
5) Install one of these diodes in D14.

This enables the following three extended modes:

1) Extended receive from 360 Mhz to 400 Mhz.
2) Extended receive from 400 Mhz to 520 Mhz.
3) Extended transmit/receive from 136 Mhz to 174 Mhz.

in addition to the existing aircraft frequencies of:

4) Receive from 118 Mhz to 136 Mhz. (AM)

(AM and FM are switched automatically according to the frequency range.)

To switch between the modes, press the [F] key for one second, then
press the [LOW] key. This will switch between:
a) Amateur VHF band (136 Mhz to 174 Mhz).
b) 340 Mhz band (340 Mhz to 400 Mhz).
c) Aircraft band (118 Mhz to 136 Mhz).

To get the extended amateur UHF receive, press the [BAND] key while in the
136 Mhz to 174 Mhz mode.

By just cutting diode 9, you enable the wide band receive on UHF
(from 400-520) and from 360-400 by hitting F and LOW.

I would be careful when cutting diode D10 out though, I did it
(I've done surface mount mods before) and my row 3 keys stopped working
(MEM, 3, etc) I am positive I didn't clip the wrong diode because I
clipped the connection leading out from the diode (you'll see what I
mean...)

Just don't get carried away, that's all..

>This enables the following three extended modes:
>
> 1) Extended receive from 360 Mhz to 400 Mhz.
> 2) Extended receive from 400 Mhz to 520 Mhz.

The above is available from the diode that I mentioned above. By the way,
the mods presented here hold some validity as they come from a tech sheet
that I got from the dealer.. a certain big mail order company down the states)

> 3) Extended transmit/receive from 136 Mhz to 174 Mhz.
>
>in addition to the existing aircraft frequencies of:
>
> 4) Receive from 118 Mhz to 136 Mhz. (AM)

This mod comes from simply holding down F and hitting LOW. If this is
all you want, don't cut anything.. I shudder at the thought at clipping
out surface mount diodes...

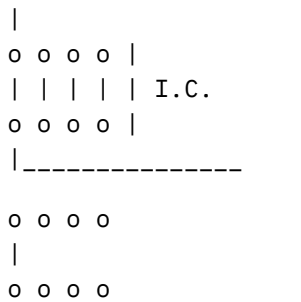
I bought a couple of TH28A's recently in the States and the guy in the shop did the mods for me on the spot.

The features I have on the radios are those described by the recent postings..

Rx AM 118.000 - 135.995
Tx/Rx FM 136.000 - 173.995
Rx FM 340.000 - 399.995 (Not 360-.. as in a previous posting)
Rx FM 400.000 - 519.995

Note: The poor thing does not like being tuned much over 500 MHz, it beeps at you in complaint.

Here are the diode settings that are in my radios:



I can therefore confirm that the above freq. ranges and the above diode settings definitely work !!

Cheers,
Iain.

I too am interested in buying an Omni VI, primarily because it
is made in the USA. I would like to know what distinguishes
the Omni V and the Omni VI. Is the Omni VI suitable for
packet, i.e. what modes if any have to be made? Is there
software to control the radio from a computer or if not
does Ten-Tec sell a manual explaining the protocol so that
I can write my own? (I am a Macintosh user and programmer.)
How does the Omni VI compare to the Kenwood 990ds? (I thing
that is their high end model.)

Best regards,

greg.jennings@jci.com or gregj@studsys.mscs.mu.edu

5377. Omni V vs. VI? Differences? Yes.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-31 22:52:00 UTC
From: ham@wam.umd.edu
Message-ID: <393seg$c00@cville-srv.wam.umd.edu>
Source record: 223102

Hmm, interesting question. Let's start from the beginning. The RECEIVER sections are identical. Same front end, same passband tuning, same IF strip and same mixers. Same options for IF crystal filters. Both have an adjustable speech processor and 20 db attenuator.

Both do ONLY CW/LSB/USB/FSK and FM is optional. No AM. Ham bands only.

They are both made of ALUMINUM and weigh only 16 lbs. Both are crystal mixed and have very low phase noise, but some non-trivial birdies, although most go away when the antenna is hooked up.

They both keep time and date. Both have great Ten-Tec QSK and the AGC can be turned off. Both can accept an external receive antenna.

Both can use an RS-232 serial port and have DB-25 serial ports.

Well, that's it for similarities (oh yeah, xmitters are the same, too).

Differences:

OMNI V OMNI VI
------ -------
Fixed 600 Hz offset Variable, w/tracking sidetone, 400-990 Hz
Audio Peaking Filter DSP lowpass filter/heterodyne killer
Audio notch, manual Automatic/manual DSP notch
No keyer Built-in curtis keyer
15-100 watts var. output 0-100 watts var. output
No RIT/XIT - use 2 VFOs RIT/XIT present
No direct freq. entry Direct entry via keypad
25 memories, w/mode and ??? memories, but it's better...
filter selections, but
only frequency display
comes up when scanning
thru. Also, no index
of channel number.
Quick tuning rate Adjustable tuning rate

The OMNI V is kind of weak on bells and whistles, while the OMNI VI has changes that indicate that Ten-Tec listened to the ARRL product review team's suggestions. EVERY single thing suggested in the OMNI V review was added in the VI.

The OMNI V was reviewed in Nov. 1990 QST, p.33. The VI was in January, 1993, p.65. I have the OMNI V. I'm used to not having RIT/XIT, and just playing w/the VFO's and using SPLIT. And I have a few mems programmed, too. Wonderful, glorious CW rig, esp with a 500 Hz filter in the 9 MHz IF and 250 and 500 in the 6.3 IF. Shift the 6.3 IF to

the edge of the 9 IF and you can get a VERY, VERY narrow passband...

The VI goes for maybe $1600, the V for maybe $1000. Your choice as
to what you want. New VI's go for $2385 from Ten-Tec. Reconditioned
OMNI V's go for like $1200 from Ten-Tec. Then add filters...at $80
a pop...although these can be had for $35-50 on the used market.

I love mine. Best thing I've ever used.

I have the HTX-202 and am quite happy with it. Below are some
articles I got off this board earlier about this unit. I don't mean to
sound like an advertisement; there are a lot of excellent units out there,
and which one is right for you depends on what wou want to do with it.
Thanks to those who posted this info before! I don't know if
there is a FAQ with this information on it, but there should be. This
is probably THE MOST frequently asked question on this board.

Rob> Does anybody know of any reviews of this radio? Any info
Rob> would be greatly appreciated...

I am also new to Ham, currently studying for the Technician test.
While I don't have much hands-on experience with HT's, I have done a
little research on the HTX-202 and recently bought one. QST magazine
reviewed several 2m HT's in October 1992, including the HTX-202.
Other radios reviewed were: Alinco DJ-162TD and DJ-F1T, ICOM IC-P2AT
and IC-2SRA, Kenwood TH-28A and TH-225A, Standard C168A, Yaesu FT-411E
and FT-415. Here's an excerpt regarding the HTX-202:

The runaway leader in in-band receiver performance, the HTX-202,
Radio Shack's first-ever 2-meter hand-held tranceiver, does the
company proud. This rig has taken a lot of pounding on the air and
in other ham forums for its lack of receiver coverage outside the 2m
ham band - something that every competing radio provides - but the
benefit is a direct payoff in adjacent-channel selectivity and
two-tone, third-order IMD dynamic range. [...] What does this mean
to you? The HTX-202 is practically immune to the interference
problems so common in urban areas thick with VHF radio traffic.

[...]

Other points in its favor include its ruggedness, super-easy
programming and operation; loud, low-distortion receiver audio; and
clear, well-illuminated display. It's the only radio in the group
that comes with both an alkaline battery case and a NiCd battery
pack. Its instruction manual is also excellent.

[...]

The HTX-202's unlit keypad can be hard to read in the dark, and this
is *not* a compact radio. [...] But therein lies the advantage:
Though Radio Shack's accessory offerings are few, the HTX-202 is
compatible with ICOM's large line of IC-2AT-series accessories.

For budget-conscious operators who value solid receiver performance
and the ability to buy locally, and who don't consider the HTX-202's
lack of extended receiver coverage a major liability, this radio
offers solid value and good basic performance.

[...]

Only the HTX-202 includes a battery-charging indicator. This
feature, insignificant as it may seem, made most of the evaluator's

wish lists.

[...]

For thos who need only ham-band coverage and 16 memories, Radio Shack's $260 HTX-202, the second-least-expensive radio reviewed here, is another super value. Its receiver performance, standard extras, and high transmitter power (6 W at 13.8 V) make it best suited for occasional portable or mobile use and the best of this bunch for home-station operation.

Radio Shack had the HTX-202 on sale for $199 recently. I bought one on the last day of the sale, but I think they're back at $259 now. At that price, you might want to take a look at some of the other HT's on the market...

You might also send mail to brettb@cruzio.com. He is organizing a mailing list for the HTX-202 and might have some information for you.

Hope this helps you.

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of

continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with alkaline packs on the 202 and my ICOM W2A, both are the same thickness. The 202 is maybe 1/4-inch wider (at widest part), and 1/16-inch taller (it's hard to compare because of the irregular shapes of HTs.) The HTX-202 does give the impression of being a "mid-size" HT until viewed up against something like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when

the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon's Quality Control has, in the past, been suspect.

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well. If the Zener diode in the bottom-feed circuit is bad, only a 9.6-vdc pack or less will work. A minor headache at the very least.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

DESIGN FLAW: Some early production (S/N 2500 and down) radios had the NiCad Zener Diode located too close to the finals, causing final transistor failure when used on external DC with the pack in place. This was remedied in production, and Tandy will remedy under warranty.

Hello All,

I'm posting this request for my Brother (A recent convert to amateur radio).

He's just bought a twin band (2m and 70cm) hand-held ICOM unit (The model number is 21E), problem is ..... No user manual with it !!. This little beast has approx 10 functions per twiddly-knob .... so usability has become a bit of an issue.

The question : Where can he get a manual for it ?? is there an address in the UK for ICOM (perhaps they'd photocopy and send one to me) ? ... Does someone want to scan one and send me the TIFF file !!!

All / Any help is much appreciated !!!!

Rob Pritchard

I would like to obtain any schematics and/or operational data-descriptions,etc.etc. I will pay all associated costs with copying or buy the manuals outright. Any ideas?? Thanks es 73 de Dan -- WA0JRD/djw@unlinfo.unl.edu

5392. New to AM Communications/Solid State AM Hints

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-01 15:43:19 UTC
From: dgontz@po-box.esu.edu
Message-ID: <395nmn$n2v@jake.esu.edu>
Source record: 223117

I just recently got an antenna that alows me to use 160m and 75m bands. I've heard some people using AM and have been able to talk with folks with little trouble. The problem is I'm not sure if I have the rig set correctly.

The rig is an ICOM 735. I adjusted the carrier insertion to the recommended 40 watts. I've found by way of talking with friends that I get the best reports by running the speech compress and keeping the Mic gain relatively low. However, I've noticed that no matter what I do the radio seems to drop power as I modulate.

Does anyone else have any experience with using ICOM 735's on Am and, possibly, any suggestions on better ways to set the rig up. Also, I'd like to hear from anyone that knows of any solid state rigs that run AM okay. I'm thinking about upgrading the rig and I want to make sure the new station will work well on AM. I'd like to stay with ICOM but I could be persuaded to change brands if there are better rigs on the market.

Thanks in advance for any and all help. I really appreciate.

73 --- Douglas, n3jxb

Vinod, I asked your question of WB6NBF who is a coworder her at Rockwell,
and a part timer at Tucker. His response:

Dale

You can send this back out for me....There are two models available,
the W21A without the touchtone pad and is selling for $299 at Tucker,
the other is the W21AT which has the touchtone pad and sells for
roughly twice the price of the non touchtone pad model.

> Has anyone used the Comet CH72S dual band flexi antenna or
> the similar one made by Diamond?
> Is this an improvement over the stock Yaesu antenna?
> Thanks,
> --Barry KC7GCO

See if you can get the specifications for the Comet or Diamond from the manufacturer. I called Yaesu about the duck that came with my 530, and got the following specs:
2m: resonant at 145 Mhz, 1Mhz bandwidth, -1.25dB "gain", <3.5 vswr
70cm: resonant: 435 Mhz, 5Mhz bandwidth, no stated gain, < 3.5 vswr.

As I operate a bit higher, 145-147.855 on 2m, and most repeaters around here are 440-445 (+5 for xmit) on 70cm, this is not an ideal antenna tuning... Think maybe the standard antenna is cut for the "other side of the big pond"???

I'd think that the Comet would be cut for our bands, and should be a better choice, but without some data, that's just guessing in the dark. If you find out the specs on the Comet or Diamond, I'd be real interested, as I'd also like a higher performance replacement to the standard duck. (besides the Cushcraft magmount I ordered for my vehicle, but that's difficult to walk around with)

5396. Yaesu FT470/FT530 low power out?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-01 18:29:50 UTC
From: rzaa80@email.mot.com
Message-ID: <rzaa80-011194112950@jungle.sps.mot.com>
Source record: 223126

I recently bought a Yaesu FT470, one of the last remaining that was lying around. Brought it to work and measured power out on both bands, and found that the VHF transmitter is putting out about 60% of rated power under all conditions. UHF side is good, actually quite better than spec.

Two friends have FT530's and ond of them is putting out low power, but his is low on both bands. The other we suspect is low due to his not being able to reach repeaters any better than my FT470.

Any one else put their Yaesu dual band on a power meter or spectrum analyzer
and measure power out? I called Yaesu and they will fix it under warrany, but I'm wondering if it will recur or if it is common?

Please email as well as reply as our mail feed is somewhat unreliable. Thanks,

>does Ten-Tec sell a manual explaining the protocol so that
>I can write my own? (I am a Macintosh user and programmer.)
>How does the Omni VI compare to the Kenwood 990ds? (I thing
>that is their high end model.)

I can't compare the OMNI VI to anything else recent, but I have had mine for over two years and I love it. I don't run digital modes, but I can't imagine why it wouldn't do it. It will run RTTY with 100% duty cycle. The RS232 interface is specified in the manual, so you should be able to program for it easily. I use a logging program that reads data off the interface, and it was basically plug and play.

: ---
: . CMPQwk 1.4 #9206 . Shin - Device for finding furniture in the dark.

Someone on the internet mentioned that their FT-900 had birdies every
50 KHz with the remote cable intalled. I have NOT found this to be true with
the FT-900 (remote cable installed) in my vehicle. When the radio's auto
tuner is tunning, there is some relay noise. The same thing happens with my
SG-230 tuner. Otherwise, the unit is quiet.

Rafael, I have a TM-733A and really like it! Especially with all of the extra features like cross-band repeat, wireless cloning, wireless remote control. You can control the TM-733A via another HT. This comes in handy when you need the extra TX capability like 50 watts output and utilizing the high gain antenna mounted on the car or home.

With a CTCSS unit installed you can decode PL tones in a scan mode. The new AIP (advanced intercept point) is designed to reject the ever increasing intermod problems. The best feature for installation is the REMOVABLE control head that can be remote mounted on the dash board.

Greetings all -

I just received my call in the mail and am proud to say
"hello" as KE4SHD (Super Ham Dude? :-)

Anyway, I am now in the market for a mobile unit and am
looking strongly at the Yaesu FT-5100. Can anyone share
with me their pricing as they've found it? I (of course)
am looking for the locations I can order from at lowest
price.

Also any experience stories with this radio would be
welcomed. I've been lurking for a while and keeping up
with the flow of messages, and it seems like most people
who own this radio are *very* satisfied.

73's!
Dave - KE4SHD

>
>Both do ONLY CW/LSB/USB/FSK and FM is optional. No AM. Ham bands only.
>

CORRECTION: OMNI VI "does FM" (if that's your thing) right out of the box.
Mine does and I DEFINITELY did not buy any OPTIONAL FM module.
And of course it receives AM OK (does not xmit in that mode).

Also I paid $62 each for my filters (plus shipping).

Also don't forget the DSP feature for getting rid certain type of
interference (works real neat).

Plus bandstacking registers, 100 memories, and more.

Call Ten Tec and ask for some literature. Or better yet get your hands
on the QST review article (Jan. '93).

I have had my OMNI VI for 2 1/2 years and it is the BEST rig I have had
in over 33 years of hamming.

5418. 70 MHz transmit and receive on a TH79E?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-02 18:46:13 UTC
From: bryant@janus.dec.com
Message-ID: <398n06$dq@nntpd.lkg.dec.com>
Source record: 223139
Cross-posted to: uk.radio.amateur,rec.radio.amateur.equipment

I apologise for my previous null posting

When the TH79E is modified for wideband operation the VHF radio
cannot operate below about 85MHz, although it is possible to get
the frequency display to indicate down to 67Mhz. Perhaps Kenwood
intended operation down to 67Mhz for some commercial application,
or perhaps it is an artifact of the software. Is there a mod that
allows the TH79E to actually operate (send and receive) down to 70MHz?

Before I get any flames etc, I should explain that there is an allocation
at 70Mhz for UK, Ireland and Gibralta. Thus the modification would
yield a three band radio. Since there are no commercial handhelds
for this band, the modification would be doubly useful.

5420. FT530 Intermod Problem?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-02 20:45:39 UTC
From: rafaels@zimmer.CSUFresno.EDU
Message-ID: <Cynr04.Hrq@zimmer.CSUFresno.EDU>
Source record: 223061

After careful research and many nights of reading this group I decided to purchase a Yaesu FT530. The radio hasn't arrive yet and I'm expecting it someday this week. Last weekend in one of the local 2m nets one of the regulars mentioned that the FT530 has bad intermod, in particular when used with an external antenna. This person also mentioned that Yaesu is aware of this and that it will perform a modification free of charge is the unit is under warranty (otherwise this mod is about $190). I never heard anyone in this group mentioning this. Is this true? How bad is it? Is it worth to send the unit to Yaesu with the risk that they screw-up other things? Need advise from FT530 owners and/or Yaesu people reading this.

Thanks,

Rafael, KE6JSR

PS: Post your comments here so others benefit from your experience.

Source record: 223141

Fellow netters,

I recently purchased an old radio from a junk/surplus dealer.
I have very little idea of actually what it is. My best guess is an
early '70s vintage comercial fm protable. I suspect it is crystal
controlled and the power (5 W) makes me think it it not CB.

Here are the specs,

Made By: Fanon Electronics
Model: T909 code:375053 5 watt / 6 channels
DOT#:168201049 and 168362045 (written on back)
Power: 15 VDC also has batt. pack on the side for AA cells
Size: approx. 12"long 3" wide 1.5" thick

On the front:
Meter for signal/batt.
Batt. saver switch
Squelch & Volume sliders
Rotary A-F Channel selector
A switch for 'delta' (+,0,-) Repeater offest ??
Power Switch
Switch marked PA
PTT on the side of the case.
Text " FET and IC Circuits "
On the back:

Jacks for mic., speaker, earphone, antenna
Antenna:
Very long approx. 4'

Does anyone know what I have bought? Can I convert it to amateur use ?
Have I just bought several evenings worth of enjoyment and tinkering ?

Thanks,
Harland

Hi

I still have a Yaesu FT-4700RH dual band mobile radio for sale.
Its max power output is 50Watts on 2 meter and 40Watts on 440Mhz.
It is different from most others in that the front panel is detachable
and remotely mountable, meaning the display panel can be mounted on
a car's dash and the main body in the trunk, for example. Included is
the sub-audible tone encode/decode chips for both bands. I am also
including an optional outboard speaker for better sound quality.

It is perfect condition, and the protective plastic clear cover on the
LCD display has never been removed! No scrathes on this display!

I am asking $400 plus shipping for the entire package listed above.

Contact me for more info.

>tnx...

Yes, they're single frequency crystal controlled. Yes you can just attach a microphone or TNC to them. An exciter is just a low powered transmitter. Hamtronics kits have been known for spurious output products if not tuned properly. You need access to a spectrum analyzer to be sure you've done it right. Peaking for maximum output with a passive detector won't necessarily give a clean spectrum, though it can happen.

>PS: Post your comments here so others benefit from your experience.

Yes, the FT530 can suffer from some pretty intense intermod, but
that's unfortunately typical of most dual banders these days due
to the wide out of band tuning range most of them offer. The FT530
isn't notably worse than the other brands in this regard. Yaesu's
"fix" is to reduce the sensitivity of the radio.

HT receivers are made "hot" in order to perform with the typical
rubber dummy load they are shipped with. If you put a real antenna
on them, they are too hot and tend to crunch. By reducing sensitivity,
some of this tendency to crunch is reduced. Try it out first to see if
you get bad intermod at locations where you intend to use it, with the
antennas you intend to use. If it doesn't bother you, don't have the
sensitivity reduced. If it does bother you, consider whether reduced
sensitivity will impair your use of the radio when using the rubber
dummy load. If that's a possibility, then use a pass cavity in line
with the offending external antenna rather than have the radio detuned.
The cavity will keep all the out of band crud out of the radio, and thus
eliminate intermod from those sources.

There are only two good fixes for intermod. The first is to keep the
offending crud out of the receiver to begin with. Tight front end
filtering, or external filters, can do this. The second way is to
establish high standing currents in the active devices in the front
end of the radio to resist being driven into the non-linear mixing
region by strong out of band signals. The former is unfortunately
not done in most amateur HTs today because hams seem to want scanners
that can also transmit instead of solid communications equipment, and
the latter would eat your batteries in a heartbeat, and is only done
in some mobile and base rigs (and in too few of them).

Gary

Bob,

Look at the Standard mobiles. Excellent receiver. In traditionally bad
areas not a peep of Intermod.

From: gwb@ucssun1.sdsu.edu
Message-ID: <39a8r3$ds0@pandora.sdsu.edu>
Source record: 223053

I would appreciate e-mail from those who have modified 51J-4s, or have suggestions for relubricating the gear mechanism.

My reciever seems to operate, however, when changing bands on my 51J-4, there is considerable drag. Also, did Collins ever make a spinner knob for the main tuning?

Thanks,

Greg W. Bailey, K6QPV

From: lralph@dataflux.bc.ca
Message-ID: <lralph.22.000EE611@dataflux.bc.ca>
Source record: 222943

I'm looking for a source for a particular vacuum tube. It is a large ceramic triode from an RF amplifier used in a peice of scientific equipment. The tube I'm looking for is a 3CX30007A. I currently get them from Henry radio in California and they cost about $1500 US or I get them rebuilt by Henry when they wear out (about a year) for $750 US. If anyone knows a source where they could be obtained or rebuilt more cheaply than that I would appreciate hearing from you. Thanks.

5438. Help: icom W2A micro surgery

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-03 14:05:02 UTC
From: vbreault@rinhp750.gmr.com
Message-ID: <VBREAULT.94Nov3090502@rinhp750.gmr.com>
Source record: 223058

Once upon a time I had a bad power connector in my W2A and tried to repair it myself. I opened up the little bugger and quickly concluded it was beyond my capabilities. Cripe! I couldn't even see it, let alone figure out how to access it. So I had the job done by a professional.

Now the antenna connector has worn out and I'm about to try it again. This time however, I *CAN* see the connector and where it's attached. Bouyed by that little bit of knowledge, I ordered a replacement connector from icom and set out to install it.

I tried to get it out yesterday but I'm stumped. As far as I can tell, I need to remove a chassis in order to get at the back side of the board the connector is soldered to, and I need to remove that board as well. I suspect the chassis is mechanically attached by the clip at the bottom and one screw on each side. I don't know what electrical connections I'll be dealing with. I suspect the circuit board that the antenna connector is soldered to is simple enough to remove, but again, I don't know about the electrical connections.

I'm not a micro surgeon. I'm not much of a service tech either. I *DO* believe this is something I could handle if I knew what I was looking for.

Can someone help me? A drawing, a word of advice, an offer to do it for me while I watch, the loan of a service manual.....

5439. ??? 220 MHz Amp from Lunar Electronics ???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-03 14:21:37 UTC
From: harris.pander01@ic1d.harris.com
Message-ID: <harris.pander01.13.2EB8F1EC@ic1d.harris.com>
Source record: 223073

At a recent swapmeet, I picked up what I believe is a 220 MHz FM/SSB amplifier made by Lunar Electronics, bearing model number 1.3M10-70L. Judging from the power transistor (and the part number above), this is probably a 10-watts-in-for-70-watts out amp.

1. Is Lunar Electronics still in business someplace?

2. Does anyone have a manual or schematic for this amp?

3. There are two extra pins in the "power" connector, which are labeled "remote." Any ideas what those are there for?

Thanks...

[...Good desc of radios features snipped...]
I think he meant that it's somewhat limited in that it doesn't have a wide open scanner front end, so you can't use it to listen to all of the nice pager and hi band intermod junk while you're trying to have a conversation on it.
Oh and you can't illegally transmit out of band either.

As I do a lot of bicycle touring, I am looking for a recommendation for a lightweight 2M handheld that can endure the vibrations of travelling many miles in a handlebar bag. Suggestions?

First off, a little disclaimer: I work part-time for Radio Shack.

Get the Radio Shack HTX-202 and the Tandy Service Plan. Other people on the net have lots of good things to say about the HTX-202 so I won't go into any detail there.

The TSP is not an extended warranty - it's a service plan. For $40 the folks at Radio Shack will repair whatever goes wrong for 5 years. I've seen a crushed tape player (run over by a truck) replaced under the TSP. I've seen a smashed scanner (industrial accident) replaced under the TSP.

Icom doesn't offer one. I wish they did. I dropped my two week old top-of-the-line icom ht 2 and a half feet onto the grass one day. It broke. I wanted icom to repair it under warranty. Icom said it was abused and the damage was not covered. They wanted $60 to fix it.

Hello all! Thought you'd like the latest scoop on these suckers.

I just got off the phone w/Larry Boyd, a Ten-Tec engineer who's
working on the T-Kits, and Eric, in the sales dept. Here's what's
up with the newest US kit manufacturer:

The catalog printed for Dayton 1994 is still valid, but make these
changes, if you want to know what's available:

1) The Argonaut II RF deck was cancelled due to lack of interest.

2) The Model 1051 Transmatch Tuning Bridge went from $12 to $17.

3) The 9-band shortwave receiver went from $39 to $49, but isn't
available as of yet.

4) AVAILABLE IN THE FUTURE:
Model 1202, SWR Bridge/Wattmeter, end of '94
Model 1253, 9-band receiver, end of '94
Model 1252, Hi-Sensitivity Detector/Amp, end of '94
Model 1251, RF Ground Counterpoise, end of '94

Model 1220, 2m FM/Data XCVR...
In talking with Larry about this one, everyone's really excited
about this one, but he admits that testing is still ongoing.
Ready by early 1995?

Explanation of delays...basically, he was honest with me about it.
The projects with silkscreened cases are taking longer than desired.
Everyone know how good the 1208 manual is? Over 100 pages worth.
Imagine what the 2m XCVR manual will be like...hundreds of pages,
hundreds of diagrams to draw...larry predicts it will take 2 months
to just perfect the MANUAL (heck, it's a BOOK, and it'd better be
accurate)!

The microphones, 2m amp, G5RV, Vari-Cap, and all of the Module Boards
are in stock and shipping if needed, as is the famous 1208 xverter.

5449. Review: JPS NIR-10 DSP Unit. (Long)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-03 19:03:07 UTC
From: gkd@bigwpi.WPI.EDU
Message-ID: <39bc5b$e47@bigboote.WPI.EDU>
Source record: 223006
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment

The following review of the JPS NIR-10 DSP unit is an updated version of one which I originally posted in the spring of 1993. The review evaluates the NIR-10 for use in voice modes only and is written from an SWL/utilities monitoring perspective. (Hams who operate SSB should also find it relevant.

The text of the original review is unchanged; all of the new material has been added at the end. The update reflects JPS's most recent NIR-10 software release, in which a dynamic peaking function was added to the unit.

WARNING: This review is _very_ long and detailed. I first started writing it for someone who was thinking about purchasing a DSP and was looking for much specific information, and it sort of evolved into a full-fledged review. With all the renewed interest on the net in DSP products, I figured it was worth re-posting. Any comments may be sent to gkd@wpi.edu

****

It was about five years ago when I first seriously thought about getting an active filter to use with my ICOM R71A HF receiver. I was doing lots of listening in the HF spectrum to Shortwave Broadcasts, Utilities stations, and hams; and had been impressed by how much more pleasant a friend's Datong active audio filter made his receiver sound. But living in a densely populated residential area, I was also facing the growing problem of wideband noise generated by an ever increasing number of computers, electronic appliances, power lines, etc. in the neighborhood. The usefulness of traditional audio filters was limited in combatting this type of problem, but the newer Digital Signal Processing (DSP) devices sounded promising. I'd seen advertisements for the JPS NIR-10 DSP audio filter, and after reading some favorable reviews, decided to investigate it. (I'd also looked into the W9GR DSP construction project which was in QST last year, but after getting feedback on both, decided that the JPS would be better suited to my needs.)

I wrote to JPS for information on the NIR-10, and also asked about the company's background and product line. Since it was only about a year ago that I first heard of JPS, I was curious as to how well established it was.

A very professional looking packet of information promptly arrived, which detailed an advanced line of DSP products; mostly oriented toward commercial communications systems. These products included Noise Reduction units, phone patches, bidirectional audio repeaters, voice modulation recognizers, switch matrices, and audio distribution products. An enclosed letter from Tom Jacks, JPS Vice President of Marketing, read in part:

"...I have enclosed a data package showing JPS Communications' present product line. Our two Amateur/SWL products, the NIR-10 and the NF-60, are included. We expect to have at least two more DSP-based products for the Amateur/SWL market released in the next few months. As you can see...JPS' primary thrust is into the Commercial/Paramilitary market. Our RTU-200 Radio/Telephone Interface Unit (phone patch) is currently being private labelled or sold to virtually every US manufacturer of HF Communications equipment. It is standard equipment in the White House Communications Agency. Why so popular? It is the only automatic phone patch in the world that works reliably on inferior telephone lines as well as good ones...

"Our NRU-500 Noise Reduction Unit is used in numerous communications centers to quiet noisy receiver audio and reduce fatigue on the operators. It is also used by law enforcement agencies...to clean up noisy surveillance tapes. The NIR-10 is a 'little brother' of the NRU-500 and is the result of many requests by agency personnel to have equipment for their ham shacks that would have similar performance to what they had on the job.

"JPS Communications, Inc. was founded in 1988 by three engineers who had many years of experience in the design of HF communications equipment for such companies as Harris RF Communications, Sunair Electronics and ITT Mackay Communications. Since it's inception, JPS has doubled its sales every year and this year looks like it will continue that trend. We currently have 25 employees, including an engineering staff of seven."

Pretty impressive...and a lot more information than I ever expected to receive. I called JPS and spoke with Mr. Jacks. He was most helpful and enthusiastic in answering my questions. A couple of days later, I ordered the NIR-10 from JPS. It was shipped that day.

Unpacking the NIR-10, my first impression was that it was a very well-constructed looking device. The controls had a quality "feel" to them, and there seemed to be much attention paid to detail. Moving across the front panel from left to right, there is a toggle switch for power, a green LED power indicator, a three-position mode toggle switch (noise/interference reduction or 'NIR' mode, bandpass mode, and bypass mode), a three position bandwidth selector toggle switch for use in the bandpass mode (when in NIR or bypass mode, this switch is used to turn on the automatic notch filter [or the rev. 3.0 "peak" mode, discussed at the end of this review]), a potentiometer to adjust the NIR level when in NIR mode or shift the passband when in bandpass mode, a red "peak' led used to adjust input volume, an output volume control, and a headphone jack.

The back panel has phono jacks for input and output audio and for remote bypassing. The latter is for hams who wish to use the NIR-10 but still be able to monitor their own transmitted signal. The jack can be wired to the transceiver's PTT line to force the NIR-10 into bypass mode when the microphone is keyed. (Audio passing through the NIR when it is not in bypass mode is delayed 130 milliseconds, which would make it difficult to

monitor one's own signal.) There is also a ground connection and a coaxial power connector on the rear panel. The power connector is a standard size, although the inner pin diameter is 2.5 mm as opposed to the more common 2.1 mm ID connectors found on other ham and SWL equipment. I purchased the optional 12 VDC 1 Amp power adapter for the NIR, although it can operate from any properly regulated 11-15 VDC 1 Amp power source. The power connector is reverse polarity protected, and all other inputs are protected to +/- 50 Volts.

The NIR-10 has three main operating modes; the NIR (noise/interference reduction mode), the bandpass mode, and the automatic notch filter (NF) mode. [Plus the rev. 3.0 "peak" mode, discussed at the end of this review.] The NIR and NF modes can be operated either independently or in conjunction with each other, while the bandpass mode can only be operated by itself. The NIR mode is the primary reason I bought the unit. It samples the input audio looking for speech content, and attenuates everything else. The multiple automatic notch filter is used to remove one or more heterodynes automatically as soon as they appear. The bandpass mode provides three vertically skirted audio passband widths which can be shifted up or down in frequency. The DSP operation may also be bypassed, allowing audio to simply pass through the NIR's audio input & output circuits.

When the NIR-10 is powered down, the input audio is bypassed directly to the speaker/headphone outputs via a relay. This should not be confused with the bypass switch on the front panel, which still routes the audio through the NIR-10's audio circuits while bypassing the DSP function. I found that the audio passing through the NIR-10 while powered up in the "bypass" mode was considerably narrower in fidelity than the audio which my ICOM delivered to the speaker when the NIR-10 was powered off. The difference wasn't very significant in the SSB mode, but when listening to AM broadcasters a lot of fidelity was lost. For this reason, it would be nice if the NIR-10 had a function to completely bypass it's circuitry without powering it off. (The unit must go through a brief diagnostic sequence every time it is powered on.) Since the necessary relay already exists within the unit, the addition of a switch is all that would have been required. (Of course, an external audio bypass can also be constructed.)

The NIR-10's audio bandwidth is obviously optimized for single sideband communications rather than high fidelity applications. (The specifications give it a frequency response of 300 Hz to 3200 Hz, +/- 2 db.) Anyone considering using it for Shortwave or Mediumwave broadcast listening should be aware of its restricted audio fidelity. Compared to the audio coming directly out of my ICOM R71A (which is mediocre for broadcast listening to begin with), the NIR-10 produced a "punchier," cleaner sounding voice; but one with it's dynamic qualities stripped. It made broadcast voices sound something like SSB transmissions. Whether this is an important consideration or not depends to an extent on individual preference and listening habits, and to an extent on the audio characteristics of the receiver being used. Sitting quietly in front of the radio listening to a clean, local signal, I preferred the sound of the ICOM's own output. But I

found that if I was moving around doing other things while listening, or if there was other noise in the room, the NIR-10's audio often made it easier to hear what was being said with the volume set at a lower level.

After noting the audio characteristics of the NIR-10, I engaged the NIR function while listening to speech on a local broadcast station. Increasing the NIR level adjust, the speech began to take on a "mechanized" sound as if it were coming to you in "packets" rather than as a continuum. (It almost reminded me of the way WWV sounds now, or of those "digitized" marine information broadcasts.) On a strong, clean signal, one would have no reason to use the NIR function. I tuned to a talk show on a weak broadcast station with considerable hiss on the signal. Turning up the NIR level produced the same "mechanized" sound, but also quieted the speaker between voice "packets." The hiss and noise on the signal was almost completely gone! The tradeoff, though, was a less natural sounding voice.

This mechanized sound takes a little getting used to. I sat in front of the radio turning on and off the NIR function trying to decide which way the audio was easier to understand, and found that comprehension with the NIR was not any better than without it. I soon learned that this was not the way to evaluate the NIR-10. The manual makes an important distinction between intelligibility and "listenability" which is worth mentioning here:

"Noisy speech is speech that has been corrupted by some type of noise...Speech which has been corrupted by noise has irretrievably lost some of its original characteristics. Complete removal of all noise...may sometimes result in speech which is harder to listen to and interpret than the same speech with some particular noise components retained. There is a trade-off between intelligibility (can one determine what is being said?) and `listenability' (how pleasing...or grating...is the monitored audio?). Maximum noise component removal may turn an irritating, noisy...signal into one that's much more pleasing to the ear, but the received speech must be understood as well. The aim of noise reduction in speech is to improve not only the listenability of the noisy speech, but to improve its intelligibility as well... Fatigue may result when an operator attempts to interpret noisy speech for extended periods. There are times when intelligibility is more important than pleasantness of the signal, while at other times emphasis is placed on listenability."

With that in mind, I tuned in my noisy talk show and went about other business while I listened without the NIR engaged. After a while I engaged the NIR and continued to listen. I quickly found listening with the NIR to be much less tiring than without it. It didn't take long to get used to the mechanized aspect of the voice, which was much easier to deal with than the noise.

The optimum amount of noise reduction can always be precisely set using the continuously adjustable NIR level control. On stronger signals, the control can be advanced to the point where all noise components virtually disappear. On signals which are down "in the mud," the control must be reduced to

prevent the desired speech from being chopped up. The proper operation of this control is very important if one is to realize maximum benefit from the NIR function, but adjusting it is not difficult with a little practice.

I found that when listening to noise-free shortwave broadcasts with good audio characteristics (such as the VOA), I would shut off the NIR-10 altogether and listen to the radio's audio directly. But in practice, the majority of shortwave broadcasts did not fall into this category. Most had some noise component (or just had poor audio to begin with), and these often sounded better using the NIR function. Program jingles and musical content would be lost if the NIR level was set high enough, since the NIR software interprets music as noise and tries to remove it.

Very weak, noisy signals are another story. I tuned in both SSB transmissions and AM broadcast signals which were barely audible and challenging to understand. The NIR-10's performance on these was mixed. In some cases, the NIR was able to remove enough of the noise to make an uncopyable signal copyable. In other cases, the NIR only made a bad situation worse and cut up the signal I was trying to hear. The manual acknowledges the NIR-10's limitations:

"...it is impossible to completely recover speech when heavily corrupted by noise...Because of this, use of the NIR mode at signal-to-noise ratios of 0 db and below may actually reduce intelligibility rather than enhance it."

I found that in most cases of heavily corrupted signals, the NIR didn't significantly improve intelligibility (there were notable exceptions though). It did a much better job improving the listenability of signals which were already intelligible. I tried punching in 5598.0 KHz USB, which is one of the North Atlantic Air Traffic Control frequencies. Most of the signals were well above the noise floor and easily copyable, but there was still a noticeable amount of noise on the signals and during the long pauses between transmissions. The NIR-10's NIR function quelled the band noise, turning it into a rhythm of low level digital "bleeps" above which the voices projected loud and clear. Monitoring the frequency became much less tiring, although I would occasionally have to reduce the NIR level to accommodate a particularly weak signal. This test was perhaps the most dramatic demonstration of the NIR's effectiveness, and one which applies to the ham bands as well.

Like the mechanized sound of the voice, the digitized "bleeping" which replaces the band noise takes some getting used to as well. Once I became accustomed to it, I usually found it much less annoying than the original band noise; primarily because it was at a much lower level. (A friend described this sound as somewhat resembling polar flutter.) The manual does make mention of the characteristics of this noise:

"...the noise left over after reduction has an "electronic" sound. This is not an artifact introduced by processing as one might think, but rather it is all that remains of the original input noise, which, because of its random nature, cannot be removed

completely. Unfortunately, this residual noise has also been de-randomized to some extent, so it occurs in bursts, Thus, it sounds unnatural and can be more annoying than white noise. The higher the level of noise in the input, the higher the level of this residual at the output."

The NIR mode does a good job removing hiss, impulse static, electric line noise, computer noise, and buzzing noises. It is not effective on static crashes, which burst through as a sharp report. The static crashes are sometimes more noticeable than without the NIR because the rest of the band noise has been reduced so much, but they also don't seem to linger as much.

The NIR mode is also not effective on adjacent channel SSB/AM interference, but this can be removed using the bandpass function. The near-vertical skirts of the bandpass mode really need to be experienced to be appreciated. Take a strong heterodyne signal and slowly adjust the bandpass shift. All of a sudden the signal will just "pop" into oblivion. The manual does note that strong signals right near the bandpass edge will cause a clicking sound in the audio; which is the digital equivalent of "ringing" in analog filters.

JPS markets two versions of the NIR. The ham version has 250 Hz, 600 Hz, and 1.8 KHz bandwidths in the bandpass mode, and the SWL version has 1.8 KHz, 2.4 KHz and 3.0 KHz bandwidths. (Other combinations are available at additional cost.) I ordered the SWL version since I was mainly interested in voice. While the 1.8 KHz and 2.4 KHz bandwidths are well chosen, the 3.0 KHz bandwidth is about as wide as the NIR-10's audio in the bypass mode. I can't find much of a use for it, and would have rather seen one of the narrower non-voice bandwidths (probably 600 Hz) included instead.

According to the manual, the bandpass function is intended mainly for digital and data signals (RTTY, packet, SSTV, etc.), which the NIR function tends to interpret as noise. In practice, I usually prefer the NIR function over the bandpass function when listening to voice signals. If there is any adjacent channel interference on SSB transmissions, I'll try combatting it with the ICOM's passband tuning control first.

This brings up an important point: Don't expect the NIR-10 to take the place of all the advanced features on your receiver. I still find myself using the rig's bandwidth filter options, passband tuning, IF notch filter, RF gain, and noise blanker controls just as much as ever. (The same goes for the low-pass/high-pass filters on the Kenwood SP-940 speaker which I use with the receiver.) They perform the same functions as always; the NIR-10 gives you additional power.

For example, adjacent channel interference in SSB may be attenuated by either the rig's passband tuning circuit or by the bandpass mode on the NIR-10. Using the receiver's passband tuning control has the advantage of removing the interference within the AGC loop. On the other hand, it's skirts aren't as steep as the vertically skirted bandpass filters in the NIR-10. An effective compromise is to use the passband tuning to get rid of enough of the interference so that it no longer drives the AGC, and use the

bandpass tuning on the NIR to remove the rest of it.

For a second example, consider the NIR-10's automatic notch filter. This filter attacks and removes most heterodynes before you even know they exist; and it can handle multiple heterodynes too (although it's effectiveness deteriorates if it tries to do too many at once). This is vastly superior to the manual, finiky IF notch filter on the ICOM, but there are times when it is preferable to use the ICOM's notch filter. A particularly strong heterodyne will affect the receiver's AGC circuit. The IF notch filter will get rid of it within the AGC loop and solve this problem. I've also found that the NIR-10's notch filter sometimes doesn't act on very weak heterodynes, which the ICOM's IF notch filter has no trouble removing.

LEFTOVERS:

I didn't evaluate the NIR-10 on CW and data modes. On CW, the manual states that the NIR function can be used at speeds above about 7 WPM. The manual also shows how the NIR-10 can be used for transmit audio processing with proper interfacing.

The audio input level is a snap to adjust using the receiver's volume control and the red "peak" LED on the front of the NIR-10 as a guide. (The output level is controlled using the volume control on the NIR-10.) An internal jumper is used to select high or low input levels. Connecting the NIR-10 to my ICOM's speaker jack, I find I have to drive the ICOM's audio amplifier harder than I'd like to when the jumper is in the high position. Moving the jumper to the low position makes the input too sensitive for the ICOM speaker jack. I may eventually try piggybacking a resistor into the level-select circuit to make the high level position a bit more sensitive.

The audio output amplifier can handle short or open circuits without damage. There is no record output jack on the NIR-10. When copying certain signals, it would be helpful to be able to toggle between the bandpass and NIR modes. This can be done, except that the same control is used to adjust the NIR level and the bandpass range. It must be readjusted every time the mode is switched. Separate controls for these two functions would have been a nice "frill."

A major concern I expressed when considering whether to get the NIR-10 was the extent to which it radiated RFI. My wire receiving antennas connect directly to the ICOM, so the NIR would in essence be sitting about a foot away from the antenna. Below 20 MHz, I have yet to experience any RFI whatsoever. Between 20 and 30 MHz, RFI does begin to show up in places. It is very low in level for the most part, but I've had a few signals where copy improved when the NIR-10 was turned off. I doubt that anyone using resonant antennas mounted a distance from the NIR-10 would notice any RFI. RFI generated in the VHF spectrum is a bit more prominent. I've heard motorboat-type sounds from the NIR-10 on my FM broadcast receiver in the shack, and on scanners and 2 meter receivers. Again, external antennas generally cure this problem too. In any event, any RFI coming from the NIR-10 is certainly much less severe than what most computers and packet stations generate.

The NIR-10 manual was obviously written with the hobbyist in mind, because it begins with a very concise step-by-step procedure for getting the unit hooked up and operational. Overall, it is very well written and complete. A schematic diagram is provided for the power supply and audio circuits of the NIR-10, and a block diagram is provided for the DSP section.

JPS states that registered purchasers will receive automatic notification of any software upgrades which are developed for the NIR-10. Such upgrades are offered to NIR-10 owners at cost (approx. $15), and are user-installable.

CONCLUSIONS:

The NIR-10 is probably more of a luxury than a necessity, but for me it was definitely worth it. One does have to take a little time to become accustomed to the NIR-10's sound and operation before it can be fairly judged. It's benefits are readily apparent on SSB transmissions, but on shortwave broadcasts they can be more difficult to recognize. A conventional audio filter may have some advantages over the NIR-10 in being able to tailor the audio response over a wider fidelity range, but the NIR-10's strength lies in its ability to remove noise from within the vocal spectrum while leaving the voice component largely untouched.

There is also an element of subjectivity in evaluating the NIR-10. I find listening to electrical static and buzzing to be especially grating, but some have an easier time overlooking these factors and are more concerned with maintaining natural sounding audio. If you're one of those people who enjoys cranking up the volume and letting the band noise resonate throughout your head, I'd put your money elsewhere. On the other hand if you're someone like me who likes peace and quiet, and prefers to listen at low volume levels without excessive strain, then the NIR-10 may be worthwhile.

[An additional review of the NIR-10 appeared in the Oct. 1991 QST (pg 36).]

****

The preceding was written and originally posted in the spring of 1993. During the summer of '93, JPS announced the release of NIR-10 software version 3.0. The upgrade PROMs, available at a cost of $25.00 to existing NIR-10 owners, offered the addition of a dynamic peaking function and enhanced notch filter performance.

The PEAK mode is activated using the bandwidth selector switch when the NIR-10 is in bypass or NIR mode. Thus, PEAK can be used by itself or in conjunction with the NIR mode, but cannot be used in conjunction with the notch filter or the bandpass mode. The manual pages included with the upgrade provide the following description of the PEAK mode on voice signals:

The PEAK mode is designed to peak up any correlated information
in the audio passband. It provides a second type of noise re-
duction by dynamically forming bandpass filters around correlated
information, thus automatically reducing the bandwidth to the
minimum necessary to pass information. The PEAK mode is most

effective on purely random noise, such as white or pink noise. When more periodic noise types are encountered, such as ignition noise or power line noise, the NIR mode or a combination of NIR and PEAK modes may be more effective.

I initially approached the PEAK mode with a good deal of skepticism. Given that it's inclusion was an afterthought and that peaking seemed more suitable with CW signals, I really doubted that it would even come close to the effectiveness of the NIR mode on voice signals. It didn't take much testing before I'd changed my mind though.

Activating the PEAK function causes the amplitude of the voice to increase markedly and the background hiss to diminish. This effect is really quite dramatic; the signals almost magically seem to rise up out of the noise. The NIR function still does a much better job dealing with electrical noises, static and similar interference embedded in the voice signal you're trying to hear. These conditions can "confuse" the PEAK function (producing an erratic output), unless the voice peaks are audibly above the noise level. When they are, using the PEAK and NIR functions together can simultaneously attenuate the electrical static and peak the voice. The two function really do complement each other nicely.

The PEAK function does not produce the mechanized sounding voice which is characteristic of the NIR mode (when the NIR level control is advanced), but it does narrow the fidelity of the voice which in some cases results in a muffled sound. The muffling generally does not occur with SSB communications signals; but with AM broadcast signals, it is often quite pronounced and can affect the intelligibility of the audio. For this reason, I generally find the NIR function to be more suitable for broadcast listening.

There is one particular circumstance where the PEAK function does especially well - dealing with thunderstorm static crashes. The PEAK function won't eliminate the static crashes, but it continues to peak the voice signals among them. This was demonstrated to me one night last summer when I was listening to a ham QSO on 75 meters. The voices were audible, but were surrounded by static crashes and were very difficult to hear. The NIR mode offered only very minimal improvement. The PEAK function did not reduce the level of the static crashes at all, but it did significantly increase the output of the voice signals. I'd have thought the guy I was listening to had just clicked on his linear. Of course, those syllables which got completely obliterated by the stronger static crashes were still lost, but overall the voices were much easier to hear. As one would expect, the PEAK function cannot do much for a signal which is so far down in the the static crashes that you can barely even tell that it's there.

Unlike the other NIR-10 modes where the audio input level does not appear to be very critical, one must adjust the input volume carefully when using the PEAK function. Too much input results in total distortion, and with too little input the voice is not adequately "seen" by the PEAK function; resulting in erratic performance. I also find that when using the PEAK

function on very noisy SSB signals, setting the receiver's AGC control to its "fast" setting usually results in more consistent peaking action.

Depending upon the signal being monitored, either PEAK, NIR, or a combination of both will be most effective; and there are still those occasions where the signal sounds best in the bypass mode with no noise reduction. Even with more than a year's experience using the NIR-10, I still find that there are no hard and fast rules determining which function to use. Trial and error is still my best guide, and it is best to try all options on each signal.

Overall, I've found that I use the NIR-10 virtually 100% of the time when I'm listening to SSB communications signals; even if it's only in the bypass mode. I've found that my receiver audio now sounds "flat" with it off. I usually put the device in bypass mode when I'm bandscanning and switch the processing on when I tune in on a signal. I'd guess that I use NIR mode processing 60% of the time, NIR and PEAK combined 25% of the time (though sometimes with the NIR level set very low), PEAK function alone 10% of the time, and bypass mode 5% of the time.

I turn on the NIR-10 about half the time when listening to broadcast stations; generally when the signals are noisy or interference is present. When it is turned on, I leave it in bypass mode about a third of the time and use the NIR function the other two-thirds of the time. I don't use the PEAK function too much when listening to broadcast signals (due to its muffling effect on the audio), but always give it a shot anyway. Occasionally, it turns out to be the perfect solution. Tuning the broadcast station in using the sideband mode (ECSS reception) sometimes results in better operation of both the NIR and PEAK functions, and eliminates problems of selective fading as well.

My friend with the Datong audio filter (mentioned at the beginning of this review) has since bought a NIR-10, and rarely uses his Datong any more. His only major criticism of the NIR-10 is with the automatic notch filter. Activating it does remove the heterodynes, but often gives the audio an unnatural "hollow" sound and a degree of distortion. Neither the automatic or manual notch filters on his Datong had this effect. I have also found that I rarely use the notch filter on the NIR-10 because of this. I'll sometimes turn it on briefly when monitoring the ham bands to get rid of a tune-up heterodyne; but if I'm dealing with a constant carrier I'll usually kill it using the ICOM's IF notch filter instead. I did not notice any difference in notch filter performance with the software upgrade.

I did end up modifying the audio input circuit of my NIR-10 so that the high input level setting is a bit more sensitive. Now if I have my ICOM's volume control set at a normal listening level, it is about the right level for NIR-10 when I turn it on. My friend has never felt that the volume setting on his receiver when using the NIR-10 was too high, but I use a very efficient speaker in a quiet room, which probably accounts for the difference.

(For those who are interested, the modification I performed involved installing a 15K ohm, 1/4 Watt resistor in parallel with R34; a 39K ohm, 1/4 Watt resistor on the left edge of the PC board.)

When ordering the software upgrade, I paid an extra $10.00 to special request bandwidths of 600, 1800 and 2400 Hz.; eliminating the 3000 Hz bandwidth which I had previously found no use for. The 600 Hz bandwidth does come in handy at times for CW, or when beacon hunting in the LF region, but I still rarely use the bandpass function on voice signals. Perhaps if it could be used in conjunction with the other functions I'd find it more useful. My receiver has pretty sharp IF passband filters, which are generally adequate for getting rid of the adjacent channel stuff.

JPS has become much better known within the hobby community since I initially wrote this review, and has expanded its DSP product line. (The NTR-1 sounds like it was designed specifically to address the issue of limited fidelity for broadcast listeners.) Other manufacturers such as Timewave Technologies, MFJ, and Radio Shack have entered the DSP area since then as well. The Timewave DSP 9+ and DSP 59+ both received excellent reviews in the October 1994 issue of "QST." They take a different operational approach than the NIR-10, but since I haven't used them I won't speculate about any performance comparisons.

****

JPS NIR-10 SELECTED SPECIFICATIONS

Audio input.....Unbalanced 22 ohm (or 47K ohm)
Frequency response.....300 to 3200 Hz +/- 2 dB
Input level.....120 mV to 2.8 V RMS
(internal level select jumper)
Absolute output delay
NIR and Bandpass modes.....130 milliseconds
Bypass mode..... 0 milliseconds
NIR mode white noise reduction
MAX control position.....Approximately 20 dB
MIN control position.....0 dB
NIR mode single tone reduction
MAX control position.....Greater than 40 dB
MIN control position.....0 dB
Time to cancel a suddenly-appearing tone
NIR mode.....About 250 milliseconds
NF mode.....About 3 milliseconds
BP mode bandwidths
Amateur..... 250 Hz, 600 Hz, 1800 Hz
SWL.....1800 Hz, 2400 Hz, 3000 Hz
BP mode center frequency.....Continuously variable 300-3200 Hz
BP mode ultimate rejection.....Greater than 60 dB
NF mode ultimate rejection.....Typically greater than 50 dB
(one to four tones)
PEAK mode White Noise Reduction.....Typically 10 to 20 dB
Speaker output.....2W @ 10% dist. into 3.2 ohm spkr.

```
Audio output distortion.....................< 0.5% @ 1 KHz @ 0.5 Watts
Input power.................................11 to 15 VDC @ 0.5A avg., 1A peak
```

: PS: Post your comments here so others benefit from your experience.

I have a 530 and just bought a Larsen Dual Band Mag Mount antenna for
the car. I have noticed quite bad intermod on the UHF side of the HT
when connected to the antenna. I have not noticed much with the rubber
duckie that comes with the radio. I have had the 530 for about 18 months
and I compared it to a friend's that he purchased less than 6 months ago.
His radio seemed much less susceptible to intermod when connected to my
antenna. Perhaps they have improved it in the later models.

Since the 440 repeater I frequent has a PL, I can use Tone Squelch to
cut out most of the intermod.

5451. Wanted: **STABLE** LNA for 1420.405 Mhz

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-03 20:08:31 UTC
From: mleech@bnr.ca
Message-ID: <39bfvv$453@bcarh8ab.bnr.ca>
Source record: 223063

I'm looking for a very stable, Low Noise Amplifier for use at 1420.405 Mhz.

I'm currently using a Down East Microwave 1296 LNA re-tuned for 1420.405.
It is, however, quite unstable, which makes it nearly unusable for the
intended application (21cm radio astronomy).

Could somone suggest a supplier of such things? We are looking for

1) Complete package (milled Aluminum box, 'N' or SMA connectors,
+12 to +15V supply).

2) Noise temperature: between 25 and 60K

3) Gain: 16 to 20dB. Less than 0.2dB passband ripple.
Needs to have moderate (better than 20dB) attenuation below 1200 Mhz and
above 1600 Mhz.

4) Stable, stable, stable. Less than 0.2dB gain/noise figure variation over
a temperature range of -25 to +25C. The matching on the amplifier
has to not cause it to break into low-level oscillations (like
the D.E.M. ones we're currently using).

5) Less than US$200 each. (We have a quote on one from Veritech
for US$1975.00 [ouch, ouch, ouch]).

Harland, it sounds like you have picked up a cb radio. Fanon was big in
the cb craze of the 70's and it sounds like you have picked up a small mobile
or even a portable unit. The best bet would be to open it up and look
inside at the crystals. If they have any frequencys labeled in the 26 or
27 Mhz reigon and you can see a modulation transformer then you have a cb.
The other thing you can do is to attach a 50 ohm load to the unit and hook
up 12 volts to the power leads and using another cb, you can place it near
the unit and key the mic and look for it on any of the 40 channels. Chances
are that you will find it in one of the older 23 channels.
Other tips would be a vinyl type cord (excluding E.F. Johnson products).
Delta tune switches and a Pa function is somehting that is found on most
cb's.

Ok, so now that I've heard good things about this follow on the IC-3200, I'm interested in more info/prices. I am probably more interested in the 3220A (low power) rather than the 3220H (high power), but would consider either. Anyone out there got one they'd like to sell? What about just comments - pro and con regarding this radio? What about expansion options, like how to get it to tune out of band?

Thanks,

Spurs can be in band as well as out of band, so a bandpass filter isn't a cure. If you can't find someone with a spectrum analyzer to check it, there are ways to do it with cruder equipment. They can be tedious though. Generally, you can tune using a frequency selective detector, and a wideband detector. If the readings don't match, you've got spurs. To find them, you can use a wide range tunable receiver to hunt for them. The FCC wants spurs to be 60 db down from the main carrier, so sensitive detectors are a must.

5458. YAESU FT-77 mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-04 08:44:57 UTC
From: etxcjog@eos.ericsson.se
Message-ID: <39csa9$rno@erinews.ericsson.se>
Source record: 223071

I recently started using my Yaesu FT-77 again - the 77 have spent 3-4 years
in the closet. Once I hooked it up on 13VDC, all looked fine apart from some
oxidization in the mic ptt. TX/RX sounds clean enough and T/R switching works fine now.
As the 77 is a simple design - some ham magazines must have published
modifications on the transciever, minor mods. improvements or features.

Q: Any mods still out there ?
pse email me and I'll summarize any input later.

Experience ? Yes ..

I was looking for packet at 9600 baud on 70cm without mods required and
also with more RF power than my old rig. Well, i got the FT-5100 to
work at 9600 but it wasn't easy. The TNC connector on the rear is
only a 3,5mm stereo plug and the data-in line is also used for PTT by
pulling it down thru a resistor. Of course this works, but when you
pull PTT low there is a DC swing on the data line. It needs a long
time to settle down so i have to set txdelay to 15ms. On some days it
works very well and i catch every packet, on the next day there are lots
of retries. Interference from other stations? Bad weather?
Oh yes, and i always have to disconnect the mike for packet as it
picks up noise and spoils the outgoing packet signal.

For voice qso the FT-5100 is difficult to operate. Only one volume and one
squelch knob to set the current band. If you change between 2m/70cm you
always loose the previous setting for the right side. The squelch works
in principle, but also opens on not so strong signals. No chance to
squelch distant stations, even if turned fully clockwise.

All in all:
For voice get a rig with separate volume/squelch controls for each band
and a squelch that also works against strong interference.

For 9600 packet get a rig with a data-independent PTT line to the TNC
and that also automatically shuts down the mike input.

The FT-5100 is a disappointment and i would not buy it again.

Source record: 223008

I recently got a HTX-202. It is a nice radio, good for a newbie like me (just got my ticket yesterday). The problem is that anytime that the radio gets near a computer (we are talking 10-12 feet in some cases), it start picking up all sorts of noise. Sometimes adjusting the squelch does not help. Do I have a faulty radio, or is this normal. If this is a common occurence, how can I use this radio for packet radio?

5463. Problems with MFJ 962C 1.5 KW tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-04 15:17:17 UTC
From: ignacy@misz.animal.uiuc.edu
Message-ID: <39dj9t$6uo@vixen.cso.uiuc.edu>
Source record: 223076

I purchased a MFJ 962C antenna tuner for its high power rating and low cost. The tuner looks ok although it does not have a quality feel. Its capacitors have large spacings, the balun is enormous in size and the open wire connectors probably can withstand 10KV!

Unfortunately switches are small, and one that switches the coil sparks badly on 80m at 200W. The sparking is between the hottest wire (useful for 10m) and one of the bolts. I eliminated it by unsoldering that wire (10m is gone now). Also, the SWR meter works accurately up to 14 MHz but definitely not on 21! Perhaps it can be retuned.

You get what you pay for, and quality tuners of that kind retail for at least two times more. I am wondering whether this tuner (and perhaps other MFJ products) should be regarded as assembled pieces of parts, where extra work is needed to make them work fine.

Just to avoid busting MFJ, their keyer/bencher combination that I purchased at the same time works very well.

I just bought my FT-530, and I believe it's pad 13.

On my radio it already has a wire jumper on pad 13. You only need
to cut it.

5467. David Clark Aviation headset

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-04 19:10:40 UTC
From: JLOLINZ1@ulkyvm.louisville.edu
Message-ID: <17064C760S85.JLOLINZ1@ulkyvm.louisville.edu>
Source record: 223077

I have a David Clark aircraft headset with a boom microphone that I would like to connect to my Kenwook TS-440S. I have the wiring all taken care of, but the microphone element is a high impedence microphone. The headset is the David Clark Model H10-40 using a model M-3 microphone element. A call to the David Clark Company found that the only low impedence microphones they carry are a 5 ohm and a 100 ohm microphone used for military applications.

The specs on the 440 indicate a microphone impedence of 500-50K ohm will work, however, I would like to get something in the 500-600 ohm range.

Anyone have any ideas?

Thanks,
Bruce WB4FBB

>rig set correctly.
>
> The rig is an ICOM 735....

Adjust the rig until it weighs over 50 lbs. smells musty and glows in the dark. AM operation with solid state is sometimes considered a radio 'sin' but maybe AM'ers are more tolerant than other species.
If you insist on continuing this sacriledge, then I suggest you get a good oscilloscope with 50 Mhz or more bandwidth and monitor your RF output. Do not connect the probe directly but stick it into the PA box or othewise loosely couple to the RF output.
Watch out for peak clipping (flat tops) and straight lines at the minimums. These are no-no's.
Without the scope, you may have to depend on comments from the receiving stations. These may or may not be accurate and also depends on what band you are on. For instance on 11 meters you can usually get it right if you interpret the opposite of whatever they tell you.
For some solid state rigs, leave the mike gain where it is normally used for SSB. Start out with the carrier insertion at minimum and very gradually increase it until the receiving station tells you you are starting to sound fuzzy or distorted. Then reduce the carrier until that goes away. Never, under any circumstances, use compression on AM. This is a cardinal sin.

>It's in need of repair and I really need a schematic desperately.

I have a Motorola S-1320-A signal generator, also from Boonton, NJ,
which may be similar to the S-1318-A, and I also want a repair
manual. Motorola told me the part number for the manual (68-81061A75,
if anybody cares), but they say it's not available any more. If
anybody knows where I can get one, please let me know!

If you call Motorola's parts identification department at
(708) 538-0021, they may be able to tell you the part number for your
S-1318-A manual, in case that helps you find it.

Sorry about the "me, too!" posting. :-)

Alas, this is all too normal. It's nothing wrong with the radio. It's
the computer acting as a broadband transmitter. To use it with packet,
you want to use an external antenna on the radio mounted far away from
the computer, and you want to shield, shield, shield, and shield some
more, the computer, monitor, and keyboard.

Ne> does not help. Do I have a faulty radio, or is this normal. If this is
Ne> a common occurence, how can I use this radio for packet radio?

Ne> 73,
Ne> Mike

Hi, Mike. Congrats on getting your ticket! And welcome to the world of RF pollution. There are lots of things out there that make noise, hash, and general garbage. Computers are some of the worst, especially older ones. The noise you're hearing is very common -- I can't hear the local repeater with my HT sitting here on the desk with the computer.

Scan the band when parked in front of a convenience store, and somewhere in the band you'll probably pick up a few signals from their electronic cash register, or maybe the modem they use to call in credit cards. I've seen modems make "dead carrier" type signals that carry more than a block.

You can attempt to shield the computer better, and use cables to the monitor, keyboard, printer, etc. that have RF suppression built in, or add supressors to your existing cables. Sometimes this is very effective, sometimes not.

In the packet community, a common bit of humor, good-naturedly at your expense, is the new ham who tries to operate packet using an HT with a rubber duck antenna sitting on top of the computer. There are two problems with that -- the hash from the computer prevents you from receiving well, and the low power and terrible antenna on the HT keep the packet systems from hearing you.

If you happen to be very close to the packet station or node you're trying to connect to (less than 5 miles, perhaps), it might work. But packet works best when all stations on a channel can hear each other, and few of the other stations will hear you.

The solution is to put an antenna up on the roof, or in the best location you can. And make it the best antenna you can get/fit. Your HT can still sit near the computer (but a few feet away would be wise), but when it's connected to the outside antenna, it won't hear the computer so much.

Good luck,

73, Gary KN4AQ, Raleigh NC

5481. Question: can I splice coax without too much loss?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-05 10:47:38 UTC
From: david_b3@sfov1.verifone.com
Message-ID: <1994Nov5.174744.1886@sfov1.verifone.com>
Source record: 223018

First a story, then a question...

I have a roof mounted 2M/70cm antenna on my car that I use with my hand-held radio. Someone broke into the car stole my radio, and cut the coax off pretty short. Yeah, I know, I should never leave it in the car. I was kicking myself for a couple of days.

Now, the good part is that the thieves realized that it was not a cellular phone, put it back in the tote pouch and left it in the bushes. The police brought it back today, only 2 days after the theft. Everything is there, including the accessories. Unbelievable. And unbelievably lucky!

It would be a bit of a pain to take apart the headliner and reroute some new coax from the roof antenna down to the console.

QUESTION: Can I splice some new coax onto the old without too much loss? If so, what is the best way to do so?

Any advice is appreciated.

Same on my new 530. The new ones have a green wire near the bottom of the
radio. The wire loops from one pad right around to the other. I'd guess
that the wire in my unit was about 2" long, making the mod very easy. I
was told Yeasu did this because may people were damaging the radios trying
to remove the solder from the pads. The radio is really packed inside and
those pads are quite small.

Good luck and don't forget to follow the instructions about resetting the
processor.

5486. HELP with AM or FM Transmission?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-05 18:07:59 UTC
From: umreim44@cc.umanitoba.ca
Message-ID: <39ghm0$4bu@canopus.cc.umanitoba.ca>
Source record: 223086

I am looking to set up a small local broadcasting system on AM or FM frequencies for a number of factories in the area. What kind of equipment am I looking for? I am completely new in the area of broadcasting, so I don't know what I am talking about. What are the rules/regulations for this? What kind of equipment do I need? I got the idea from the local drive-in movie theater. A system like this would be nice, only more powerful. I need a 5-mile transmission radius. ANY HELP or ADVISE would be GREATLY appreciated! E-mail me any comments! Thanks in advance.

Sound not just normal but quite healthy. Just make sure your antenna
(or even the whole set) is than the 10-12 feet from the computer that you
say is needed!

You'll be an oldbie in no time!

>replace a tube type Progress Line transmitter, and Mastr Pro Receiver

>snip<
Why is it necessary to publish a mod? This is not really a mod, all you are
doing is taking a range three radio to a range two. The exciter modification
is nothing more than eitght or nine capactors, a couple of coils and a resistor
or two. The exciter filter should also be replacd. Just look in the model
chart and you will figure it all out. Best of all, the parts are all still
available from Motorola. The receiver is nothing at all to convert. Simplyu
throw away the front end and replace it with a 01-80771p65. That may not be
the correcpart number but whatever the part number is on the front end, it
ends with a "66". Simply order the same part number, but end it with a 65.
That beats the hell out of trying to rewind coils and trying not to tear up
the plating on the front end cavity. Also, it yally like self abuse,
use one soldering iron when trying to solder in your new coils. One iron is
simply not hot enough to do the job. Use two 45 watt or greater irons as this
is the only way to get that cavity hot enough to properly flow the solder.
If you don't get it hot enough, you will have an intermittant front end.
Also the parts to be changed in the receiver are only five capactors and if
memory serves, one resistor. It's all called out in the manual.

Now, power amps are another story. I did the breakdown once and found to
properly modify a 110W range three p to a range two means changing almost
all but three parts on the board. This is both expensive and annoying.
The easier and better way to guarentee proper results is to replace the
pa board with a new one and just keep the transistors from the old one.
This way you know the thing will tune properly and your collector current
will not be off the scale. Also remember to replace the PA output filter.
They are reasonably cheap.

The point is, and I don't want to start a flame war here, all of the research
to do what you want to do has already been done for you. All you havto do
is get your parts list together and trot on down to your local Motorola shop
and ask them for the parts. They are not that expensive. Doing the job
right with the proper parts changes will keep your equipment stable, clean

and out of other service's receivers and make for best relations in the RF community that we all have to share.

If you or anyone has any questions about conversions of Motorola or General Electric equipment, drop me a note and I can give you a pretty good idea of what needs to be done, right down to the part numbers. I can even sell you the parts for less than what you would pay at your local Motorola shop. If there is any interest, I have a couple of Micor Compa Station repeaters here set up for the 142-150Mhz band that are the real McCoy, no conversions necessary. Just toss in a couple of channel elements and tune them up for ham repeater service.

I might even have a voter or two laying around...

The downward power indication is just showing you that you are running
way above linear power. The upward mod is being clipped and flattened
and the downward mod is okay, so the average is dropping.

Reduce the power until the average is flat. If you have a scope you
will find it easier.

5501. Cooling HeatSink on TS50

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-06 14:21:07 UTC
From: david@stat.com
Message-ID: <wPHDVc1w165w@stat.com>
Source record: 223026
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I use a TS-50 almost exclusively on pactor ... this puts a heavy duty cycle on the radio, with the heat sink usually getting quite warm.

The internal fan seems to have problems keeping up with this, so I'm thinking about using an external fan to help keep up the load.

Would it be better for the fan to blow air across the heat sink to cool it, or rather for the fan to draw air across the heat sink, or does it not make any difference?

tomsunman@aol.com (TOM SUNMAN) needs some help:

> I'm waiting for my tech license to arrive and I'm playing with my new
> HTX-202.

Congrats on the achievement!

> The manual says to clear all memory turn OFF the transceiver and
> press F + CLR then turn on the transciever. I did this and nothing
> cleared! Everything I put in was STILL there.

Turn off the HT, press F and CLR and hold them pressed while turning the
radio back on.

> Also, When attempting to store a calling frequency I press CA and 146.000
> keeps coming up on the display. I can't seem to store the frequency I want
> in the memory. The freq I want to store doesn't require a subaudible tone.

Follow the instructions in the manual, and it'll work... you just:
1. Press VF (the "D" key) and then manually put in whatever frequency you
want as your CA frequency. Once that frequency is dialed in, you
2. Press CA and the OLD calling frequency will be displayed.
3. Press and hold the Function button, and then press and hold the M-WR
(memory write) button for about three seconds until you hear the beep. At
that time, you'll notice the frequency displayed in the CA channel will
change from the old one, to the new one.

> I also noticed that when I activate the power save mode nothing seems
> to happen. Any help or advice much appreciated!

IMHO, don't worry about 'power save', a useless bell&whistle (again, in my
own opinion).

> Oh, one more question. What does listen on the input mean? I hear this
> once in awhile. "I'll listen on the input". Like someone is checking there
> signal or something. I know repeaters use an input and output frequency so
> I imagine that has something to do with it.

Often, folks wish to move off the repeater onto a simplex frequency (where
both stations transmit and receive on the same frequency). By checking
the repeater's input frequency, I can know whether I can hear you well
enough that we could chat on simplex, instead of going through the
repeater.

Another time you'll hear it is when a station just doesn't get into the
repeater very well, and someone will try and see if they can hear that
station's signal better (on the input) than the repeater does.

> If so, what is the best way to do so?

"Too much loss" is a relative term. You will have loss, any time you introduce something in the cable... a pretty fair loss if you splice it (imagining you soldering the scenter conductors together and then the outer conductors, taping everything up, etc. This certainly has been done many times, and may work for you, depending on how much loss your transmission path can stand.

A better suggestion, though, is to have proper constant-impedance connectors installed and mate them together (for example, put BNCs on each end the cable to be spliced, and mate them with a female-to-female BNC connector). This way, the loss should be negligible, and if you want, you can tape it up after the connectors are installed, stuff it out of the way, and not worry about it any more.

5507. FT530 noisy?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-06 17:51:19 UTC
From: rafaels@zimmer.CSUFresno.EDU
Message-ID: <CyuxLJ.L88@zimmer.CSUFresno.EDU>
Source record: 222964

Greetings to all:

Got my new FT530 Friday and after I programmed the local repeaters in both 2m and 70cm I noticed a noise while scanning in UHF and listening in VHF. The noise was repetitive and followed the same pace of the scanned UHF -empty- memories. Also, It was only heard when the squelch in the main (transmitting) band (VHF) was open. The noise is not heard while scanning VHF -as subband- and having the main -transmitting- band in UHF. Have you noticed this in your radios?

Please reply ASAP! I want to know if this is "normal" (which shouldn't really be) or my radio is deffective.

73, Rafael (KE6JSR)

A good friend of mine reports that he has a TS-440s (Kenwood) that will not go into the transmit mode. Has checked the rig out with a fine tooth comb...(he should have used a scope)...and still no cigar. He suspects that the problem is in the microprocessor. Bill - N3DC has the defective TS-440s and would be very grateful to anyone who might be able to provide guidance in resolving this problem. Please e-mail me directly and I will summarize and post the solution, as soon as it is identified. Thank you for taking the time to read and hopefully respond to this posting. Any info at all would be very much appreciated.
Tnx

Greetings all

I have an Alinco DJ-560. While cleaning it out today (yes I tear it down and clean it once in a while) I saw what I always see. A small orange wire underneath the battery plate. I was wondering if anyone out there knows what this wire is for. And if I were to cut it what would happen. Thanx in advance and please post responces here as my server is having problems and not taking email right now.

5514. Plantronics StarSet use with FT530?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-07 02:36:28 UTC
From: leber@panther.warm.inmet.com
Message-ID: <CyvLws.Guv@inmet.camb.inmet.com>
Source record: 223034

I have an old Plantronics StarSet headset (the behind-the-ear style) as used by the TelCo. It has the standard two-plug connector used with operators equipment. The plug box has a small amplifier (I guess) circuit.

Can anyone help with directions on how I might modify this nice headset for use with an amateur HT (specifically, a Yaesu FT-530)? I'm basically a software type, but I've been known to pick up a soldering iron at times (and sometimes not even grab the hot end).

At this point, I have disconnected the four conductor coiled cable which leads from the earpiece to the plug/amplifier box, though they can be reconnected if necessary.

Anyone?

Thanks in advance,
Tom

Howdy.
I'm considering a study abroad this summer in Wuerzburg. I would like to take my handheld with me, and possibly find a club station or something to do some hf operation as well. How easy(or difficult) is it to get permission to operate in Germany (reciprocal license) for 10 weeks between May and July, should I get accepted to the study abroad program I'm thinking of? What is the procedure to get this permission? Any info that can be given about this stuff is greatly appreciated.

Thanks much...

5525. Icom R-71 Modification to 37 mHz

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-07 05:15:30 UTC
From: willco788@aol.com
Message-ID: <39kd5i$6c7@newsbf01.news.aol.com>
Source record: 223044

Modification of the R-71A to 37 MHz
TF Marcotte, N5OFF

This article will cover the use of the Willco Electronics Company's ICM-1024 No-Fail memory board for Icom products as a means of achieving a 37 MHz upper frequency limit for the Icom R-71A receiver. This modification is done without tampering with the RF circuits of the radio.

Caveat: Don't attempt this modification if you are uncomfortable with soldering small electronic devices. With that said, lets continue.

Some Icom products, the R-71A and the IC-751 to name two, have a volatile random access memory (RAM) board which stores the radio's operating parameters (i.e. band limits) as well as 32 user programmed memories. The RAM is kept alive by a small lithium battery. In most cases, the battery should last a long time, ten years or more. Battery health may be assessed at any time by comparing its present voltage to an approximate 2.7 volt warning level. If by some chance this battery should fail before you've had the opportunity to solder in a new one, then the board (not the whole radio) must must be returned to Icom for replacement of the battery, and for reprogramming of the RAM chip.

Willco Electronics markets a product called the ICM-1024 No-Fail memory board. This product has two key features:

1). The board offers the user 32 x 32, or 1024 memories.

2). The board has the radio's operating parameters stored on a read-only memory (ROM) chip. In other words, there is no danger of the radio becoming inoperative due to battery failure.

The Willco board does in fact have a RAM chip and battery like the Icom, but this chip holds only the memories, not the operating parameters. If the Willco battery fails, then one would only lose the memories (albeit 1024 of them!).

It should be stressed that careful replacement of the battery on either of the boards when the voltage drops to 2.7 volts will prevent a memory loss of any kind.

Installation of the Willco board is relatively straightforward, and well documented in the instructions. Mechanically, the board (not a kit) presses right down into the original Icom connectors. To enable the 1024 memory capability, one must make one logic unit connection and eight connections to two chips in the radio's matrix unit. The

instructions don't mention that you can get the no-fail capability and 32 memory function by not wiring the board in at all, just press it down to the original board's connectors. This may be a good alternative to solder-shy users.

Being that the Willco board holds the operating parameters, the company took the opportunity to extend the primary default upper band limit to 31.0 MHz (the lower limit is moved as well, from 100 KHz to 10 Khz). The default limit was not programmed higher than this because the Icom R-71A (and the IC-751 as well) shut down at that frequency. That is, the Icom control chip that tells the radio to turn on the proper VCO (one of four) and bandpass filter (one of five) for the top band doesn't address frequencies higher than 31.0 MHz with its factory wiring. When the frequency exceeds 31.0 MHz, all VCO's and bandpass filters are switched off.

The Willco boards of post-December 1993 manufacture have an alternate upper frequency limit of 55 MHz programmed into a separate R-71A program location. This location can be accessed by jumpers. The jumper configurations for the various radios that the Willco board supports are:

JP01 JP02 JP04 JP08 Icom Radio Note

0 0 0 0 R-71A 31 MHz upper limit
1 0 0 1 R-71A 55 MHz upper limit
1 0 0 0 IC-745A
0 1 0 0 IC-751A
1 1 0 0 IC-271A
0 0 1 0 IC-471A
1 0 1 0 IC-251A

With the jumpers installed properly, the radio will now program up to 55 MHz, but will only operate up to 31 MHz.

There is a solution to this problem, however. The R-71A's control chip has an unused pin than turns on at frequencies greater than 31 MHz. The solution is to wire this pin into the top VCO and bandpass filter circuit to keep then turned on above 31 MHz.

This is done by first cutting the trace from the control chip pin's original path for the top band, and wiring in two diodes. One diode connects the original path for the old top band, the other utilizes the formerly unused pin on the control chip to keep the top VCO and bandpass filter turned on above 31 MHz.

These are the steps necessary to perform this modification:

1). remove the top and bottom covers of the radio. Make sure that your radio power is off, and that the radio frame and soldering iron are grounded.

2). remove the option unit installation plate from the bottom section of the radio and gently fold it frontwards. This is the board that holds the remote control board, the speech synthesizer, and the computer interface unit. Your radio may have some or none of these options installed.

3). The large exposed board will be the logic unit. On this board, locate IC-14. This is the IC that controls the bandpass filters and VCO's for the various bands. Pin 17 (refer to your schematic) of this IC goes high between 22 MHz and 31 MHz. Remove the screws from the logic board, and gently turn it over.

4). On the underside of the logic board, locate the circuit trace from IC-14, pin 17 (goes to C28 and R41) and sever this trace near the chip.

5). Install a small diode from pin 17 to the near side of R41 (this duplicates the original path of the trace you just cut) with the polarity such that current can flow from the chip to the resistor. I used 1N914 diodes, Radio Shack number 276-1122.

6). Install a second diode with like polarity as in step 5 from pin 18 (pin 18 is not shown on the schematic, but you can locate it as the unused pin next to 17) to the same point as in step 5, the near side of R41. This new circuit path will allow the chip to switch on the top VCO and bandpass filter above 31 MHz.

Now, with this accomplished, you should verify that the radio receives at 31.100 MHz. This will confirm that the wiring change was done properly. You will soon find, however, that the radio will only receive up to about 32 MHz now, because the VCO will go out of lock at approximately this frequency.

Icom originally employed this top VCO for an 8 MHz range, between 22 MHz and 30 MHz. The VCO actually has a lock range of about 15 MHz, however. This generous margin may be exploited by adjusting C107 in the PLL unit of the radio (the trimmer of four closest to the front panel in this unit). Carefully adjust this trimmer until a maximum locked frequency limit is reached. This should be about 37 MHz or higher. All the while, verify that you still have VCO lock at 22 MHz. In my radio, a top frequency of 37.95 MHz was reached.

That does it. The radio will now receive up to 37 MHz, and you are ready for some VHF-Low banding.

Since no modifications were done to RF circuitry, I was originally concerned about the performance of the radio above the original design limits. More ambitious readers may be able to achieve higher limits and better performance by tackling the RF and VCO circuits, but I elected not to.

Sensitivity fiqures for the modified radio are shown below, in terms of a dB reduction relative to an S9 signal at 24 MHz (optimum).

Frequency dB sensitivity reduction
MHz relative to 24.0 MHz

22 -2.5
23 -2

As you can see from the fiqures, the radio performs relatively well above 30 MHz, up to about 33 MHz, with no RF modifications.

Another advantage of the Willco board is its shear memory capacity. I have used several of its 32 banks of 32 memories to store all possible commercial and military FM frequencies. This way, in the scan mode, I can monitor openings from all over the country. Foreign languages are not uncommon when the band is really hot.

In conclusion, I have found that modification of the R-71A opens up a whole new way of 10 meter band spotting for me. The radio has a "big sound" on FM that scanners simply don't have.

Willco Electronics can be reached at P.O. Box 788, New Lenox, IL 60451. Phone (815) 723-6564. The board cost $124.95 plus $3.00 shipping.

I have an old R70 that recently developed a strong birdie on
9.465 MHz that renders it useless around the 31 meter band.
Anybody had a similar problem who can recommend fixes? Thanks all
advice.

There may be a bad connection in the shielded cables from the PLL board to
the
Main PC board. There can also be a bad ground on the display board. If
the screws that mount top and bottom covers are loose, interferance from
the uP board on the bottom of the radio can also cause birdies.

I was reading the manual for the Yaesu FT-11R, and I noticed
that it can store 10 (as I recall) six-character page messages.
Are there other 2m-only HT's that can store multiple pages with some
characters so as to convey a message? I want to be able to
receive page messages one after the other w/out overwriting previous
pages or locking out subsequent ones.

thanks

jb

The YELLOW SHEETS have shown MLA-2500's going for roughly $450-$700, as I recall. The 8875 tube compliment goes for about $230 [best price noted "new" from a private sale] or around $350 from a dealer. So, figure two new tubes cost about the same as the price of the used rig, hi. 73,

>
>73's
>
>Tom

Tom,
To clear your 202 you must press and HOLD the F+CLR while you are turning the unit on. As far as the CA, I can't remember how to save it. Press the CA button (be sure that CALL is present on the display), select the frequency and offset (+/-) and press F+MEM (I think).
You won't notice any change in operation between SAVE and normal modes. This mode powers down the receiver for short periods of time. The display stays active the entire time. You will notice a savings in the battery in SAVE mode.
"Listening on input" means that you listen to the transmitting station instead of the repeater. For example if your repeater is 146.34/94 your rig transmits on 146.340 and receives on 146.940. The repeater, on the other hand, listens on 146.340 and transmits on 146.940. When you listen on the input you are listening on 146.340 (the repeater's INPUT.) This is useful if a station is having trouble reaching the repeater but is strong enough for you to hear direct. To do this with your 202 press F+REVERSE and you will notice that your display frequency changes and you are now listening on the INPUT of your repeater.

Hope this was helpful.

Kevin

: occurence, how can I use this radio for packet radio?

Congrats on getting your license! Unfortuately what you describe is all too common. Computers "generate and use" RF energy, and have a nasty habit of radiating lots of it. Your best bet is to tighten up the computer. Make usre all the cables are connected correctly, with the little screws in place. Make sure that the case has all it's screws, and that any metal plates covering holes are there (like those covering slots with no board). This should help some. If it persists, install ferrite beads on the cables entering and leaving the PC. Make sure that where metal touches metal (like at the case to chassis joints) that there is a good, clean, paint-free connection.

To help minimize the RF pickup by the HT, you might want to consider using an external antenna. Even a small 1/4 wave outside the room (on the roof...) will help since it's farther away and there's a wall between. Good luck!!!

I disagree. I have spent more time chasing down cheep radios that
generate so much garbage they polute the spectrum. Most hams are fine
with the typical ham radio gear, when used at home or in the car. When
they start using this stuff in a repeater then they start causing problems.

If you don't want to do a lot of work on these radios look for the Goverment versions of these radios. All you have to do is pop in a new set of crystals and tune it up. It's possible to take a police radio (151 to 161 Range Radio) down from 155 to 146 but why bother when there are 136 to 151 range Goverment radios available. These radios are moseley Military as the other goverment services are 161 and up.

>--
>Buddy Brannan, KB5ELV

Operating reciprocal in DL is easy. ARRL can send you an info package. All
it takes is DM15, along with the right form, sent to the DARC (the German
ARRL-equivalent). It's usually best to find somebody there who can
bank-transfer the money to them for you, so you won't have to pay a large fee
for monetary conversion in the US. The reciprocal permit will allow you
three "calendar" months of operation (like May 1st to July 31st).

Help would be appreciated.

I would like to hook up my PK232 to my Omni VI using the FSK mode.
If anyone has successfully done this, I would greatly appreciate
the details. In my 232 manual it says something about needing a
resistor for this mode.. but may be outdated or not apply to the
Omni VI.. but want to make sure.

I believe that the FSK mode is best for PACTOR, RTTY.. it was on
my Kenwood 850 because you then could use the filters. I have
purchased the digital filter for the VI and want to make sure I
can use it.

thanks in advance for any help

I have the MFJ Versa Tuner III - rated at 1.5 KW (I don't recall the part number but it's probably the same). Ever since I got my linear and started using a my newly put up 160m dipole, I've had problems with the tuner.

First, not more than three hours of use on the new antenna, and I had an arking problem that literally shut me down until I opened the tuner and fixed it. Here, the asemblers ran the wire for the power board such that it ran right against the inductor coil. Once I started to use the higher power on 160m, the think arked and make a nice carbon spot where the wire touched the inductor. You should have seen the flashes of light behind the display before I figured out what was going on.

Next, I noticed the knob that changes antenna selections was loose. I thought at first it was just the knob itself and tried to tighten it up. In the process of tightening it the rod connecting to the switch came right out of the panel. Here it was loose inside the tuner. Again I needed to open the thing and fix something.

In all honesty, I think this tuner is just a raw deal. I don't know why MFJ is having such trouble with quality control on this thing. I do know that this is my first and only MFJ purchase. I don't won't this type of agrivation when I buy something brand new.

I recently bought a new Ameritron ALS600 solid state linear. I'd like to compare notes with any other users of this linear.

How is your linear working out? What types of experiences have you had with it? Have you had any problems with operating the thing? What bands have you been using it on?

From: dbraun@cad717.Your.Domain.Here
Message-ID: <39lv98$n8p@inewssc.intel.com>
Source record: 222972

Who makes the smallest, lightest 12V power supply that will run a HF rig?
I assume it would be a switcher. I am currently using a Lambda switcher,
and I am not bothered by RFI, but the thing is huge and heavy, and a want a
small, easy-to-transport one.

From: jerry@bashful.isi.com
Message-ID: <39m6pr$8go@bashful.isi.com>
Source record: 222973

I'm looking for recommendations for a good 2M or 2M/70CM rig for mobile use.

Since room to mount a radio in my car is rather limited, a rig with a detachable front panel is desirable. Also desirable is a rig with a good receiver, i.e., I'm looking to buy a ham rig, not a scanner that can transmit. I live in an area saturated with high-band and paging transmitters (the SF Bay Area) and know from experience that a rig with a wide front end will be killed by intermod.

Also desirable is a reasonable number of memories (20 or so) and some way to scan them and a CTCSS encoder. Fifty watts on 2M would be nice, but not absolutely necessary.

From: dbushong@wang.com
Message-ID: <Cyx8qC.3w7@wang.com>
Source record: 222978

I need to buy one of these really bad for the other contests this month and I wonder if anyone can tell me a) if you have one, b) whether or not you like it, c) differences between the DSP-9, DSP-9+, DSP-59+, and the MFJ-784.

If you can't read between the lines, "I need to buy" means that I'm fascinated by the technology. Also, I could have used some more selectivity during the CW SS contest, since I used the default filter that comes with the FT-900.

I'm going to get the CW filter in time for CQWWCW, but there is the SSB SS in two weeks, and I expect to have a new op who probably can't dig much out of pileups and static, and I wonder how much DSP would help either one of those problems. I've been a ham so long my brain and ears are useless for much else, so I don't need it as much..... in fact, I can usually hear a few callsigns in the noise whenever a truck rumbles past my apartment, but that's a different story.

Thanks for any info, e-mail or followup post would be fine.

I made an adapter for my DC that plugs in to my ICOM 2AT and 24AT. Worked fine after I installed a Pot. to pad down the audio level. Sound quality is about the same as DC on the Air Band radio ('crisp', with not a lot of lows...). I did not apply power to the mic element. I just started experimenting on the bench and got it worked out. However, I did have to go flying to adjust the mic level correct in the cockpit environment...

> but I'm wondering if it will recur or if it is common?

After reading your post I thought I'd check out my 470. Well,
after some quick tests, I got 4 W at VHF and 3.7 at UHF. I thought this seemed
low, so I checked the SWR while the old coax switch was inline. It was
showing 1.65 on UHF. After pulling this, and the SWR down to below 1.1:1, the
numbers are 4.8W on VHF and 4.5 on UHF.

This is on a 13.0 V supply into a 50ohm load thru a Yaesu YS500 V/UHF meter.
I'm using "Cable experts 9913 equiv" cable, PL259 type conns.

Well, so much for that switch...

The only thing I really disliked about my Omni V was that the receiver
has zillions of birdies! It was so annoying that I have taken to using a
FT-990 as the primary rig. I take it the birdies are still there on the
Omni VI? If not, does Ten-Tec have a trade-in plan for their older rigs?

Otherwise, great rig with a very robust receiver.

5569. ICW2A Internal Battery Replacement\

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-08 08:13:07 UTC
From: fax@sparc4.Ico.Olivetti.COM
Message-ID: <9411080813.AA15598@sparc4.ICO.OLIVETTI.COM>
Source record: 222987

Hello,
my Icom IC-W2A HT has run out of the internal "CPU Battery" as it is called
on the user manual. I opened the unit and the battery model is a 3 Volt
Panasonic VL 2020. Needless to say our local dealer does not carry the same
model and suggests to go for a CR 2020 which is a lithium battery. Does anyone
know if this kind of battery would fit?
I'm a little stranged since I've always assumed that lithium batteries were
not rechargable while looking at schematics it looks like there is some
recharging circuitry, plus the user manual says that when the unit is new
it should be left connected to either a battery pack or to a battery
charger for a couple of hours in order to get the internal battery charged.
The question is : is the internal battery really a lithium model or it is
some sort of NiCd (althought the voltage is quite odd) ??
Any help on this would be greatly appreciated.

5571. SURGE SUPRESSORS RATED

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-08 12:02:38 UTC
From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9411081202.0GX4800@mms.raleigh.nc.us>
Source record: 222909

CONSUMER REPORTS RATES SURGE SUPRESSORS

Surge supressors can be a useful item in a ham shack, with or without a computer. Sorting out the claims on the boxes at the computer store can give you a headache, though.

"Consumer Reports" November 1994 issue includes a review of tests on supressors. CR never gets really technical in their reviews -- they're intended for non-technical people. They do mention that they fed spikes up to 6 kV, and most of the supressors limited that spike to less than 500 volts on the output line. Some didn't, though, and some provided that protection once and were dead.

Price and performance tended to fall in line -- the highest rated supressors cost between $50 and $75 ("console" models, intended to sit under the monitor on the desktop, were more expensive, up to $125, but still highly rated).

As prices fell, so did performance, although the "second tier" prices ranged from $17 to $60.

Among the important items to look for in a supressor are a UL 1449 rating of 330 volts for all three possible pairs in a standard AC line (line, neutral, ground), and phone line protection. 330 volts is UL's minimum rating.

I looked up the supressor that protects the KN4AQth, an APC Surge-Arrest 7T. Although its case said it met the 330 volt UL rating, the test results showed it passing spikes between 400 and 500 volts. It fell in the middle of the ratings pack.

I gave Cyndi a Trip Lite Terminator for her birthday earlier this year (hey, she suggested it!). The non-phone-line version turned up on top of the list. Her phone-line protecting model wasn't rated.

And BEWARE: the article highlites a device called a "First Defense All-Purpose Power Strip." That "First Defense" is deceiving -- it's just an extension cord, not a surge supressor!

Kristian -- Try stopping by EEB in Vienna, VA (just west of Falls Church. I believe that their phone is (703) 938-3381. There is also Maryland Radio Center in Laurel, MD (northeast of DC). I think that their phone is (301) or (410 . . . the area codes in MD recently changed and I'm not sure of the correct one here) 725-1212. Also, there is Ham Radio Outlet in Woodbridge, VA (about 20 miles south of DC). I think that their number is (703) 494-8750.

Enjoy your trip to the US!

: Want to use this radio with partner's business band handi once and awhile.

I don't want to attract flames, but what you propose to do is illegal.
All radios used in the commercial services must be "type accepted" - a lengthy
and expensive certification procedure that all manufacturers must go thru.
See Title 47 CFR for details of all the regs relating to communications.

Warning to others....

There are rechargeable lithium coin cells on the market (and have been for about 6 or 7 years). They are not interchangeable with the standard CR/DL/BR types. The Panasonic VL series are a Lithium/Vanadium Pentoxide couple and available from places like Digi-Key (800-344-4539).

We will continue to see additional rechargeable lithium batteries emerge on the market (Lithium/Ion), especially in cellular phones and laptop computers. At this time, individual charge control of each cell is the only acceptable method for recharging multi cell lithium batteries. Use caution when working around some of these newer technologies. They may not be as forgiving as NiCad.....

Source record: 222933

Add to the Yaesu FT-11 features:

Alphanumeric labeling of memories and does messaging (might or might not be important to you).

1.5 watts max power with 4.8V battery, 4W with 7.2V battery, 5W with 9.6V battery. With the small battery it's slightly smaller than the TH22 but has 1.5W vs 3W for the 22. The power difference would generally not be significant, but could be...

Lighted keypad, excellent display lighting.

Receives airband out of box, but mine has atrocious (unusable) sensitivity in that range. Might be a problem with mine or a problem with a particular rev. I haven't pursued it.

Up and down buttons for volume and (shifted) for squelch, no knobs for these functions.

Needs an adapter, which also contains a fan, for use in your car (with 12 volts). The fan is probably an excellent idea, but the adapter is probably expensive. There is no power plug-in on top.

-Paul C.

The JSC Amateur Radio Club, W5RRR, has both, as well as an IC-781. (Thanks, Yaesu, Icom, and Kenwood, for the donations!) Of the two, to me there's no comparison: the FT-1000 is easier to operate, much less confusing, and (important to me, but maybe not to you) much more pleasant to operate full break-in CW. The Kenwood has an annoying thump on every keydown in the receiver in CW mode.
If I were buying, it'd be the Yaesu.

Don't forget that the Alinco ham HT's are not FCC type-accepted for business band use and even though you may be able to get it to transmit in the 150 MHz band, it would be illegal.

5589. Need help with PAGE on Kenwood TM-251A

Message-ID: <39p0gf$n9b@merengue.worldcom.com>
Source record: 222913

They were popular for a while but if your friend paid more than $250 he did not get a good deal.

Looks like a TM-231A, 331A, 431A or 531A but has two bands. Most features and functions are also comparable to this series of Kenwood mobile radio. However, only one band can be used at a time (no sub-band monitor).

I have one of these and it is constantly dumping it's memory. -- Not very happy with it.

Cheers ... Phil Usher - KM6AA

5591. Re: Uniden HR-2600 10 meter rig

In a previous article, X32KB@CUNYVM.CUNY.EDU () says:

>Anybody out there have any experience with the Uniden HR-2600 10 meter-only
>mobile rig? (Yes I know 10 meters is pretty dead.) I would like to hear
>any info someone has on it. Please e-mail me to x32kb@cunyvm.cuny.edu
>Thank you.
>
I recently purchaced a new HR-2600 and have been trying it out both mobile
and on a base type antenna. I am happy with the purchase and the only
niglets that I have are that I wished that they would have made the pl
tone encoder as part of a panel accesable feature that you could punch a
button and the display would display the tone and you could then toggle
the frequency up or down using the frequency knob or the up/down buttons
on the microphone. The way you change tones is you open the side of the
case up (the side with the speaker) and using a pencil, change the dip
switches on the synth board.
The second thing would be have some sort of memory for frequencys. This
would be great.
Now, if only Uniden would have made a HR-5600 6 meter rig at the same power
levels and features of the 2600. They would have had a real winner.

From: lakki@krksun.krk.fi
Message-ID: <1994Nov9.091439.1260@krk.fi>
Source record: 222922

I am facing some problems (?) with my TH-79. I would like to have the cross
-band repeater feature activated, but it wont go on. I think that there is
a diode in wrong place at the diode matrix!

My unit is a europe version, possibly it is the reason why it does not work.
Have anyone inspected the diode matrix, or have a list of it and its
functions?

Any e-mail appreciated.

I posted a while back about power out of Yaesu dual banders. This is a
summary of the responses I have gotten so far.

> After reading your post I thought I'd check out my 470. Well,
> after some quick tests, I got 4 W at VHF and 3.7 at UHF. I thought this
> seemed low, so I checked the SWR while the old coax switch was inline.
> It was showing 1.65 on UHF. After pulling this, and the SWR down to below
> 1.1:1, the numbers are 4.8W on VHF and 4.5 on UHF.
>
> This is on a 13.0 V supply into a 50ohm load thru a Yaesu YS500 V/UHF meter.
> I'm using "Cable experts 9913 equiv" cable, PL259 type conns.
>
> Well, so much for that switch...
>
> Joe - AA3GN

Mine makes 4 watts on both bands with the standard voltage battery.
I happened to be using it as a signal source for some antenna testing
this weekend and had it feeding the Bird. I did note that under high
VSWR conditions the VHF side folds back to about 2 watts. The UHF side
doesn't. That was for VSWR over 3.5:1. Of course battery voltage makes
a difference in output. With the 12 volt battery, it makes more power.
I wasn't using that battery this weekend, so I can't say exactly how
much more.

Gary Coffman KE4ZV

Hello there Jim. I did the similar test on my Yaesu 530 and found out
that it was perfectly balanced on a 12 Volt input.

I got 5 watts high power UHF and about 4.9 watts VHF
I got 3.1 watts on L3 uhf, 3.2 watts L3 VHF
I got 1.5 watts on L2 uhf and 1.4 watts L2 VHF
Finally, I got 350 mwatts UHF L3 and 500 mwatts VHF

Important: All these were measured on the center tuned frequencies!

VHF: 146.000 Mhz UHF 445.000 MHz

Any deviation from these frequencies will cause the numbers to change a
bit.

These tests were performed on a professional spectrum analyser and with a Bird Wattmeter.

73's, I hope you can get the problem solved.

David Cameron Amateur Call : VE7LTD

I have not yet metered my 530, but as soon as possible, I will do.
Would you please repost an article with the results of your networld inquiry?

73s, Stefan

Additionally, my two friends with which I was initially comparing, did some more measurements on their radios. One FT530 seems to have a software problem, as it puts out the same power no matter what power level he selects on either band. The other was found to put out normal power when connected to a 12V supply. The battery pack he carried in the woods was connected wrong and only putting out 6V. He subsequently damaged it while testing due to a power supply voltage spike. So it looks like all three of our radios will be going back to the factory for some repairs.

Thanks for the info. Low power doesn't seem to be a widespread problem.

5606. Best 2m mobile for packet?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-09 18:08:19 UTC
From: kanefsky@halcyon.halcyon.com
Message-ID: <39r36j$8v@news.halcyon.com>
Source record: 222929
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I'm looking for a 2m mobile radio that will work well for packet (up to 9600bps), but which won't be used exclusively for packet. Actually, I plan to use it as a base-station first while using an HT along with a portable TNC and notebook computer running TCP/IP as the mobile end of the link. Later, I'd like to get a more serious base-station and use the radio I'm about to buy as the mobile end of the link.

So far I'm looking at the Kenwood TM-255A (which is a 2m all-mode mobile with a detachable faceplate) and the Icom IC-281H (which is a 2m FM transceiver with 440 receiver). These are at opposite ends of my price range, with the Kenwood being much more expensive than the Icom. Both of them have data jacks and claim 9600bps capability out-of-the-box, but recent articles suggest that most FM-only transceivers aren't suitable for 9600bps packet.

I've heard various bad things about Kenwood in these newsgroups before, but I don't really see anything comparable from the other major brands. Does anyone have any experience with these radios, especially with respect to packet? Any other suggestions would be greatly appreciated as well.

Thanks,

--

From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9411091809.0PI8S00@mms.raleigh.nc.us>
Source record: 222846

Ne> Anybody out there have any experience with the Uniden HR-2600 10
Ne> meter-only mobile rig? (Yes I know 10 meters is pretty dead.) I would
Ne> like to hear any info someone has on it. Please e-mail me to
Ne> x32kb@cunyvm.cuny.edu Thank you.

Well, I bought one used for $125, and I think it was worth that...
its performance is OK, but operation is a bit clunky.

The think I miss the most is memories... there aren't any. Moving from
the low end of the band/SSB to the high end/FM is a lot of button pushing
and dial twisting. Also, T/R switching is v e r y slow. In fast,
contest-style operating, I have to clip off my last word and hope the
receiver recovers before the other station says too much. (I've seen
mods to improve this, making it fast enough for packet, even.)

And it's pretty big, lot's bigger than the average 2-meter mobile radio.

The receiver seems ok, and the noise blanker works pretty well. I've made
a lot of contacts with it mobile in the past year.

Good luck,

5608. RE: GOOD 2M OR 2M/70CM

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-09 18:09:23 UTC
From: kn4aq.gary@mms.raleigh.nc.us
Message-ID: <9411091809.0PI8L00@mms.raleigh.nc.us>
Source record: 222945

Ne> I'm looking for recommendations for a good 2M or 2M/70CM rig for
Ne> mobile use.

Ne> Since room to mount a radio in my car is rather limited, a rig with a
Ne> detachable front panel is desirable. Also desirable is a rig with a
Ne> good receiver, i.e., I'm looking to buy a ham rig, not a scanner that
Ne> can transmit. I live in an area saturated with high-band and paging
Ne> transmitters (the SF Bay Area) and know from experience that a rig
Ne> with a wide front end will be killed by intermod.

Ne> Also desirable is a reasonable number of memories (20 or so) and some
Ne> way to scan them and a CTCSS encoder. Fifty watts on 2M would be nice,
Ne> but not absolutely necessary.

I have both a Kenwood TM 733, and an Icom 2410. The 733 has a nicely
detachable front panel (and the radio itself is quite small), but it
is not very immune to intermod, even with the "AIP" circuit active.

The 2410 is the most intermod-immune radio I've seen, other than a
Motorola commercial receiver. The 733 can hear a pager mix "S-9," and
the 2410 doesn't even know it's there. It's a fairly small radio, too,
but doesn't have a detatchable panel. Since it's getting a bit old,
I've been seeing more for sale and some fairly low prices.

Even with that good intermod performance, it has a wide-band receiver,
including 800 MHz.

I haven't played with the new Icoms, so I don't know if they are also
good at intermod rejection.

Good luck,

73, Gary KN4AQ, Raleigh NC

Source record: 222936

I'm looking for a high quality, stand-alone electronic keyer, preferably with some memory capability. Keyboard use would be nice, but will mainly be used with iambic paddles. AEA has a new keyer (KK-1) which is mainly a keyboard keyer, but also appears to work with iambic paddles. Anyone had experiences with this? Their older "Morse Machine" is about what I'm looking for (I think), but is apparently discontinued. I am avoiding MFJ like the plague, having purchased my one and only piece of M.F. Junk!

The ability to use the keyer with more than one rig, without changing plugs would also be nice.

>
>QUESTION: Can I splice some new coax onto the old without too much loss?
>If so, what is the best way to do so?
>

If you do the splice properly, you might have a tenth of a dB or
two loss, so splicing is perfectly OK.

After resoldering the center connector use some of the dielectric
to reconstruct the proper cable structure, and fasten this
with *little* insulatung tape (the latter may be lossy).
Dont solder the outer braid, put some extra braid over
the job to ensure the integrity of the outer conductor.

>- Jerry

Jerry...

Call Communications Specialists at (800) 854-0547 and order a SS-32SMP encoder. It will set you back abt $30 with the shipping.

Call Icom at (206)454-7619 and ask them to fax their mod sheet showing the power and signal injection points for the 4AT.

Go to your local electronics parts store and get a 5- or 6-circuit DIP switch. You will need 5 for tone selection...the 6th can be used to turn the encoder on and off if you wish. Also get some 30 ga. wirewrap wiring. It is tiny stuff, but it will solder OK.

You will have to cut a hole in the back of the rig above the power and offset switches to fit the DIP (the thinner the switch, the neater the install.)

Follow the instructions that you get from Icom and ComSpec.

I just did an install on my 3AT...took me about 2 hours, and most of that was cutting the hole in the case.

I didn't have any trouble with tone level...the control op of the local repeater checked it on the service monitor for me and found it to be within accepted limits, so I left it alone.

Have fun....

>are 136 to 151 range Goverment radios available. These radios are
>moseley Military as the other goverment services are 161 and up.

I agree. Here's a list of what was found in a Micor that was purchased
for $50 (I'd love to know what service it was in - maybe Canadian?).
The radio came with speaker, mic, control cable, PL reeds and head.
Channel RX TX
1 141.175 139.650
2 141.500 139.975
3 141.425 140.500
4 140.425 140.425
5 141.275 139.750
6 141.275 141.275
7 141.150 139.625
8 141.250 139.725

Recently I found a 250w factory 141mhz base station that had been field
converted into a repeater (shield kit and one card in the control
shelf). Paid $450. Move two jumpers and it's 330w. Complete with two
sets of spare tubes and manuals. Ham band stuff is around...

I believe that 136-150mhz is commercial and police in Canada. And
440-450 is commercial in Europe. Years ago I used to run a U64MHT
Motrac as a mobile that I had converted from 464/469mhz and duplexed.
The sensitivity sucked. WA6KLA pointed out that the book for the base
version (L44MHB) listed a 440-450 front end module and had both USA and
european addreses for Motorola in it, where the mobile book I had did
not list the 440 front end and had only USA addresses. I borrowed
his base book, ordered out the parts, and used a Microflame(tm) torch
(can do a needle flame) to unsolder the old helicals and range-change
the front end. I also changed out a few capacitors in the multiplier

chains... Ran fine after that. So you can stretch a radio, range-change
a radio, or you can look further and find Canadian radios...

Look in 73 & QST for ads from Communications Specialists. The TS-32
is a standard board for these conversions, and if you ask when you
order they will include a mod sheet. Don't skip the part about hooking
up the audio filter - I did, and the audio quality through the speaker
from a person who is running a little too much PL encode level sucks.
I had to go back inside and finish the installation.

I was wondering if anyone knew the extended transmit mod for the IC T21A. I know there is also an extended recieve mod that is a keyboard mod, could someone email that to me as well?

Email at jhollow@ultrix5.cs.csubak.edu

As the ex-service manager of Diawa when it was out here on the west coast, all I can say is, "Get the Astron".

The over voltage crowbar that Diawa had was on their 35 amp models, and it was nothing more than a voltage sensitive circuit that connected a relay contact across the AC input line. That's right, I didn't type that in wrong.

I had a suppy lose regulation on the bench in the shop and after the smoke cleared, I found most of the traces on the "protection" board missing.

Diawa power supplies have a nice chassis, heatsink and rubber feat, but you would be better off to throw the circuitry away and buy a regulator board from Astron and install it in the cabinet.

I still have my 12 Amp model. And I use it for a test supply, but it has a 15 volt crowbar made by Lamda connected across the output.

Try a simple modem and a `software` TNC. the modem might cost
as little as 20$ if you build it and the software is on FTP
sites.
The modem IC is manufactured by Texas Instruments, I do not know
a source in the US. It is known under the name Baycom of "poor man's
modem.

Stuart Biggs (sbiggs@jpintox2-ncd.cisco.com) wrote:
: Does anyone have any experience with both the Kenwood TS-950SDX and
: the Yaesu FT-1000D rigs?? I'm considering buying one or the other
: but have no comparison data (other than what the respective
: manufacturers tell you).

An interesting question I had to sort out for myself a while ago, when I decided to buy a new HF radio. To get anywhere you have to have a clear understanding of your personal preferences. They could be very different to mine.

I was shopping very seriously for a good radio, and I got hold of, measaured, and opened up a good variety:

IC781
IC765
TS950
FT1000

I design RF test equipment for a living, and have access to equipment beyond that usually available to reviewers.

****

The IC781 was clearly the most tempting one to have a look at first absolutely bristling with "features", I know it's not on your list of two, but what I found sheds some light on current premium radios in general.

Dual Receive in this radio is actually pretty crude, it was the first on the market sporting it. I found it a big nuisance to try to decide WHICH of the two frequencies selected, that something interesting had appeared on momentarily. Winding a balance control to and fro while waiting for it to appear again soon convinced me that this was a feature I'd really never use.

The spectrum display is a Neat Idea, but general congestion on HF, and the preponderence of modes without constant carriers make it less valuable in spotting the most desirable (=smallest) signals. Big signals are easily seen. This sort of display is much more use on VHF radios where clearer channelisation and more favourable modulation types make it a great aid. I like the version on the R9000, but have found audible signals too low to show on the plot, also the max width of sweep is much too narrow for searching VHF/UHF.

High output power is also less attractive than it might seem, the 781, 950, 1000 all claim higher power than the usual 100w standard. The

amount extra amounts to a fraction of an S point, so if you want more power you really need to go to a full blooded linear amp. Linear amps all seem to be designed to be easily driven to full output by 100w radios, so there's little real advantage to the power levels offered.

High voltage output stages do have a potential advantage in lower distortion. Don't assume that a manufacturer's feature list including this means that they didn't spend this advantage in squeezing more gain out of a stage to save on the cost of driving stages. The 781 and 765 have got particularly good, TX intermod performance. The 950 and 1000 were not so good. The joke is that the 765 uses 13.8v power internally.

The 781 reciever has a good clean synthesiser and nice-sounding, effective, filters. The front end intermod performance looks good, but degrades miserably with close-spaced unwanted signals. It looks like the second mixer is easily overloaded by signals that pass the first IF filter.

On the good side, the 781 has good: synthesiser, filters, tx distortion. CW dot lengths are not mutilated as much as is common in Japanese radios.

On the bad side, the receiver is flawed and its chief "features" do little of any value.

At its price, I felt this radio was better at impressing casual visitors than at communicating with interesting places. It was the first to be eliminated. I felt I could have thrown a lot of parts of it away and fixed a couple of areas to be left with a very good radio.
This radio doesn't sell well, probably because of the price.

****

The TS950 dual receive facility is not quite as crude as that in the 781, but still isn't at a useful level. The above remarks on PA power and voltage apply. I see that the ARRL review shows TX intermod that is not at all exceptional, despite the PA appearing in the "features" list.

synthesiser cleanliness was not as good as the 781, receiver filters sound less clear, front end intermodulation was not as good. The real strength of this radio is in the variety of effective passband shift and notch facilities. This radio really looks the part, full marks to their stylists, but I eliminated it from my list once I'd got into the FT1000
I think this radio sells well because of its appearance, and most people's faith in its manufacturer.

****

The FT1000, with the optional RX input filter board added seems to have two genuinely usable receivers, you can even fit optional IF filters to the auxilliary Rx. You can listen to the two in stereo. If 2 recievers in one box is important to you, this is the decider.

Rx filters are OK, but not as clean sounding as the Icom ones. Rx front end performance was the best of the bunch. I have doubts of the value of switched cap audio filters compared to filters early in the IF.

Synthesiser cleanliness seems good.

I could live with one of these.

****

The 765 is the radio I actually bought. Funds on-hand were sufficient for any of the others, but, I felt this one best suited my preferences irrespective of price.

It has the clean synth of the 781, it has those beautifully clear sounding filters top-and-tailing its IF. The 250Hz CW filters (2 units) are pricy but similarly good. It has a Rx front end not quite as good as the FT1000, it does not have the close-in intermod problem of the 781. The IF notch is more effective under the most difficult conditions than an Audio notch can be. The TX is equal cleanest, Tx audio quality is good and gets unsolicited compliments, despite my voice. The speech processor is effective and sounds good. With 13.8v supply intenally, I suppose I could modify it for car-powered use.

There are two drawbacks. QSK causes some mutilation of CW dots, you need to either use the internal keyer with its weighting control, or ensure that your external keyer has a similar control. More seriously, the IF shift control is pathetic, switching it on switches out one IF filter of the pair in use - the most important one. There are some mods that allow you to change this to work in different ways. It does not come close to the versatility found in the 950. Because of those clean filters, nd the good clean Audio, I've not fount this to be much of a problem. The notch is a delight.

****

Since buying the 765, I've used the other radios on occasions, but haven't regretted my choice.

I would have gone for the FT1000 but I preferred the clean filters and the delightfully clean Tx audio to the slight Rx intermod advantage of the FT1000.

****

These are purely my personal opinions. I've tried to give enough background so that you can apply your own tastes. I hope I've helped.

Cheers
David GM4ZNX

Those are programmable limits for vfo scan. Set the lower limit
frequency you wish to scan in L1, and the highest freq range in U1.

I'm not sure the U1 U2 L1 L2 positions store offsets and other info,
but I guess you could at least use them for simplex memories.

5637. HF amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-10 13:50:30 UTC
From: junger@rsg1.er.usgs.gov
Message-ID: <1994Nov10.135030.18583@rsg1.er.usgs.gov>
Source record: 222861

I have been thinking about about getting a 5-watt QRP rig both for use as a QRP rig (naturally...) and also as a backup for my standard HF rig. For use as a backup rig, I would like to buy or preferably build a solid-state HF amplifier that would take the 5-watt QRP rig and give it something like 100 watts out. I would suspect that this would be a rather common desire, but I can't seem to find such a beast described in the Handbook or for sale in any of the catalogs I've accumulated. Do they exist? Advice and ideas welcomed.

From: gthorbur@ub.com
Message-ID: <Cz241o.FJL@pippen.ub.com>
Source record: 222863

My ICOM 725 evidently has a soldered-in coin Lithium backup battery.
The manual says it should be replaced by the service center. Looks
easy enough to me, but I know some ICOM products run into major memory
problems when the backup voltage goes away.

Should I wire a parallel 3v battery to the circuit while I am replacing
this? Or is the issue static discharge thru the soldering iron?

John,

Check out W1FB's QRP Notebook for the QRP linear projects. You may not
get 100W out but it will give you a nice boost to 30W or so.
Also, check out the PA deck on older ten-tec's like the triton or
century. They use low drive and pump out 50-100W from a push-pull
transistor pair.

Message-ID: <philkeys-1011940945590001@ptpm012.olympus.net>
Source record: 222866

I just recently bought a Standard C5718DA dual-band mobile. It is very small with all the controls and display on the mic. I put it under the front seat and attach the mic to the dash with velcro. I also have a mic extension cable so I can take the mic outside the car. I use a CD cassette adapter in the car radio to use the car speakers (2M on the left, 70cm on the right). I also carry it inside and use it as a base station and for packet (has 9600 baud TNC jack). It has an antenna duplexer and CTSS decode standard in the base price.

So far I am quite satisfied with the Standard. It has a good reputation for intermod rejection. The dealer where I bought it is 2 blocks from a paging transmitter. He says severe intermod desensitizes (?) the receiver and you hear nothing instead of noise.

WTB an instruction manual (not the detailed "service manual") for a Kenwood TH-26AT 2 meter HT. If you don't want to part with the manual, what I really need is a copy of the parts dealing with the controls -- what the buttons do when pressed in what sequence. And what the A, B, C, and D on the DTMF pad do; what the "tone" indicator really means, etc. A Xerox copy would be sufficient.

Please reply to gassew@txpcap.hou.bp.com or FAX to 713-560-4296 or snail-mail to

I have decided to sell my HF station. It seems that I don't
have the time or interest right now to keep up with the hobby.
My station consists of the following items. Everything is in
mint or near mint condition.

Yaseu 751A HF radio
Vibroplex keyer
MFJ 949E antenna tuner
Astron 35A power supply with meters

Asking price is $1100 plus shipping

Please reply to newman@maine.maine.edu

>The manual says it should be replaced by the service center. Looks
-snip-

Gary:

I have replaced both Li coin cells in my Icom 751 and R71A using the parallel method, just to make sure I didn't lose anything. I'm not sure how sensitive it is and I don't recall any caps in the circuit that might hold it up for a bit. Not sure about your 725 though, it may be quite different. 2.7 to 2.8 V is a good indicator that the battery is on it's way out.

I always use a grounded tip iron for safety, but think you'll be ok if you use some good static precautions.

Good luck.

5652. need info on unknown Hallicrafters receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-10 20:50:48 UTC
From: cornelius@eisner.decus.org
Message-ID: <1994Nov10.155049.7358@eisner>
Source record: 222875

A friend of mine purchased a Hallicrafters shortwave receiver at a swap meet and needs to know what model number it is. There does not seem to be a model number on the radio, and not only is there no tube placement diagram, but the tubes that were in it are obviously not the right ones.

It is a relatively small table-top receiver, perhaps 12" wide and 8" high, with a large slide-rule dial. The tubes are octal-based, and it is a transformerless, "AC-DC" design. Looks like 35Z5 and 50L6 are supposed to be two of the tubes, although some RF/IF style metal-can tubes had been placed in those sockets instead.

Any ideas what set he has, and what tubes it will need?

Also: there's something missing underneath. Looks like it might be an antenna coil or oscillator coil - wires were clipped coming from the band switch, and one of the brackets remains with a small piece of what might have been a small coil form. I suppose he will have to wind a new coil from scratch if that is what it is, so if anyone has a matching set that we can get dimensions from, it would be very helpful.

He could also use a circuit diagram for it if you happen to have one.

Thanks in advance for anything you come up with!

5655. Need help with TS-440 AT-440

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-10 21:40:03 UTC
From: mac@cis.ksu.edu
Message-ID: <mac.784503604@depot.cis.ksu.edu.cis.ksu.edu>
Source record: 222802

I recently bought a Kenwood TS-440S at an estate sale,
so I can't ask the seller this question!

My "new" rig DOES contain the AT-440 (I looked), but I can't get it to work.
When I follow the instructions on page 15 of the TS-440S Instruction Manual,
at step "3" (Place the AT TUNE switch to the ON position....") the AT TUNE
indicator does NOT light, I do NOT hear any motor noises at all, and the
CS mode indicator lights IMMEDIATELY.

I've tried the process several times on several frequencies on several hambands,
and I know the antenna is NOT a good match on most bands, so I think the AT-440
SHOULD at least TRY to do something!

Any suggestions?

I just ordered a TE systems linear amp (25 watts in / 175 watts out at 440 MHz). The company came highly recommended from several sources. On the phone the people were an absolute joy to work with, helping to determine my needs, very knowledgeable, friendly, etc. Not like many companies with untrained personnel who could care less whether you deal with them or not. On the basis of my interaction with the company, plus comments of others, I cancelled my order for a Mirage amp and went with them. So far, at least, I am very impressed.

I have a Kenwood TS-430S HF tranceiver. I would like information on
the X-verter output of this radio. I plan on hooking it up to a
Down East Microwave DEM432-15S Transverter. I am looking for the
output power of the Kenwood thru the x-verter port and the compatability
between the transverter and the Kenwood.

specs on the transverter:

input 1mw max @28Mhz

The transverter currently covers two segments of the 70cm band,
432-434 and 435-437Mhz. I would like to modify the the transverter
to cover 444-446Mhz instead of the 435-437Mhz sector. Any info on
this conversion would be appreciated.

I would also like any comments on the operation of this transverter by
anyone who has operated one.

5665. Re: IC T21A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-11 03:50:53 UTC
From: AE85%NEMOMUS.bitnet@ACADEMIC.NEMOSTATE.EDU
Message-ID: <10NOV94.23594311.0072.MUSIC@NEMOMUS>
Source record: 222886

I have seen the mod sheet for the Icom T21A as well as the insides of this neat little radio. According to the mod sheet, wideband RX is accomplished be removing diode D15 on the logic unit. Wideband TX is accomplished by removing diode D14 on the logic unit. Then hold the [B] and [#] keys while powering up.

WARNING!!! These are VERY small surface mount diodes and I suspect it would be no trick at all to trash your radio with a bungled "diode-ectomy". Also, the usual disclaimers about type acceptance for most non-MARS/CAP uses apply. If you break your toy, or get put in the pokey, don't come running to me! (BTW, if you are brave enough to try the operation yourself, a good schematic will be needed to identify the two diodes in question. IS THERE A NON-SURGICAL MOD FOR OUT OF BAND RX FOR THIS RADIO? PLEASE POST IF ANYONE KNOWS!)

Cheers!

>I am considering purchasing a Mocom-70 (VHF low band) and retuning for 10
>FM. Does anyone know how to read the Model # and decipher the operating
>band and power output. Any other suggestions, to include retuning, would
>be greatly appreciated.

Motorola model numbers follow a very logical system, what you are interested
in is the leftmost part of the model number, in your case, it should read something
like:
Ux1BBU-xxxx
Where ^ is the power output (e.g. 4=30 watt, 7=100 watt)
^ is the band (1=30-50 3=150-170 4=450)
The rest deals with rx and tx type and the various features.

A word of caution, make sure that the radio that you get is a 25-40 Mhz version
as they are very difficult to move down from the 40-50 Mhz range.

5668. Re: Kenwood TM-733A vs. TM-742A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-11 06:38:39 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <39v3hf$enh@umcc.umcc.umich.edu>
Source record: 222890

I've operated a 733 in my house for the past few months, and a 742 in my car for about 2 years. Both are great. 733 is more flexible in terms of features & programming, but has fewer memory channels. 733 also has a 9.6kbps packet port.

Remote-mount options for the 742 will let to split the control head into two pieces. With the 733, the remote head is one piece.

I'm describing stuff that you should already know from reading the Kenwood literature, though...

You only mentioned wanting 2m & 440. If that's the case, get the 733. If you want to add --or might in the future want to add-- 6mFM, 222MHz, or 1.2GHz, or need a lot of memory channels (100 per band), get the 742.

Kenwood might be replacing the 742 in the next year or so, but the 733 was just introduced this APR at the Dayton Hamvention.

I can conceive of a material impedance discontinuity, but a material loss? I doubt it unless you introduce moisture, a dry joint or very lossy dielectric between the inner and outer of the co-ax. And none of those are probable if you use any reasonable amount of care.

> book or are there articles on commercial radio conversion?

I guess the commercial equipment coming on to the surplus market in the States is quite different to the stuff we get over here, but if it's of any use, there is an excellent book by Chris Lorek, G4HCL called 'Surplus 2-Way Radio Conversion Handbook', published by Argus Books, ISBN 0-85242-946-0, which deals with the conversion of Pye HF/VHF/UHF equipment to the various amateur bands.

5674. HTX-202 xmit problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-11 13:24:39 UTC
From: needell@unhggs1.unh.edu
Message-ID: <NEEDELL.94Nov11082439@unhggs1.unh.edu>
Source record: 222798

I've been expereiceing a problem with my HTX-202 and wondered if anyone else
has ssen the same behavior. I run the 202 at home with an external 13.8 V
supply (with the battery back removed) and use the batteries when I'm out
of the house. I took the HT outside was listening to a few friends on the
local repeater (so receive is fine) but when I tried to join it, no xmit!
The XMIT light comes on whe I push the ptt but there is nothing regestered
on the S-meter and no response from the repeater. Definately no output.
I tried switching batteries, hi/lo power and antennas all to
no avail. I planned to head over to Radio Shack and let them deal with it but
deceide to ry it on the external supply first. Voila! when I connected it
to the 13.8 V all was fine. I disconnected it and slapped in the nicads and it
worked like a charm!. Well - all was well for two days , then it all happend
again! Thsi time I took it to Radio Shack while it was still unable to
transmit. Its still under warranty. I'm waiting to hear what they find.
Has anyone else had this problem? Any suggestions?
I checked and rechecked all the obvious things. That is,
XMIT was NOT inhibited . The battery works fine on another rig.
Just thought I'd share the experience. - Jerry - N1SJQ

5675. ICOM 751A not Yaseu 751A

Newsgroup: rec.radio.amateur.equipment

Hi,
I'm a new radio amateur and I'd like to have some information
about the 2m HT - YAESU FT-11R.
Is it good as they say???
Is there any problems with it???
What can I do with this kind of stuff???

Thanks

>problems when the backup voltage goes away.
>
>Should I wire a parallel 3v battery to the circuit while I am replacing
>this? Or is the issue static discharge thru the soldering iron?

I *believe* that this radio is a later generation than the ones, like
the IC745, that had volatile programming. All you should lose during
a battery change is any channel information stored in memory. I think
the reason they want you to send it to the service shop is that lithium
coin cells have been known to explode if accidentally shorted, and because
they don't want you mucking around in the radio with a soldering iron,
the "no user servicable parts inside" syndrome.

To be safe, wire in the temporary 3 volt supply (2 AA batteries will
work), and use an *isolated* tip soldering iron to change the coin
cell. That's what I did with my 745, and I didn't lose the programming.

Gary

> can tubes had been placed in those sockets instead.

Thanks to all who replied. Looks like it's an S-38D or E model, five octal tubes, transformerless, slide-rule dial - so now we're off to the public library to try to track down a circuit diagram.

5681. Need Tower Advice

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-11 21:27:35 UTC
From: nick@cs.unc.edu
Message-ID: <3a0nk7$44e@altair.cs.unc.edu>
Source record: 222805

Any advice and experience would be appreciated. Any other manufacturers
I should look at? Is Aluminum better than Steel?

I am considering spending some serious $$ on a crank-up tower.
A) Yes it has to be a crank-up because of city zoning regs
B) I've got some tall trees on a ridge I'd like to get over
C) Motorized because it'll be some distance to the shack

I figure I want to mount the following
1) Some kind of tri-bander, maybe with WARC coverage
(because I am a casual DX'er but would like some chance
at getting through)
2) a 5 el 6M beam
(because I used to have fun on 6m years ago)
3) a ?? el 432 MHz beam for ATV
(I'll remote the ATV gear in a garage near the tower to
keep 432 MHz feed length down)

adds up to around 10-16 sq. ft. depending on how many el the tri-bander
is

I am considering the following:
Hy_Gain/Telex HG-70HD 70' 16 sq.ft. @ 60 mph
U.S.Towers HDX-572MDPL 72' 30 sq.ft. @ 50 mph
HDX-589MDPL 89' 30 sq.ft. @ 50 mph

thanks,
Nick KD4CPL

Just got my IC2SRA. I need the Mods for it.

I already got the D19 mod in the init matrix, I am not sure what it does but I will try it. Anything else?

Also, what about the receiver part? Any way to extend it below 50MHz or over 950MHz?

Or to speed up the scan speed?

Thanx!

VE7VAR

Message-ID: <3a1b3m$eg6@pith.uoregon.edu>
Source record: 222810

Are you placing the AT TUNE and AUTO THRU swithes in the ON position when you try to tune the antenna? I have a 440AT and the antenna tuner makes noise when it tries to tune - also the ON AIR and AT TUNE red lights light up and the CW green light does too. After a few seconds it will quiet down.

Don't know if that helped.

**Max :)

Hello, Angelo. Here is the poop on the TM-733. Sorry, but I don't have
any info on the TM-742. Hope this sheds some light on the TM-733.

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
Release 2.0 Updated October 1, 1994

Updates for Release 2.0 are identified by parenthetical statements.
There is also some new information sprinkled throughout the previous material
either to update it, to correct misinformation, or to be more specific.

This document is a compilation of Internet messages from
Steve Haehnichen KE6JGK and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Refer to diagram below. (Inserted into Release 2.0)

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio.
It will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

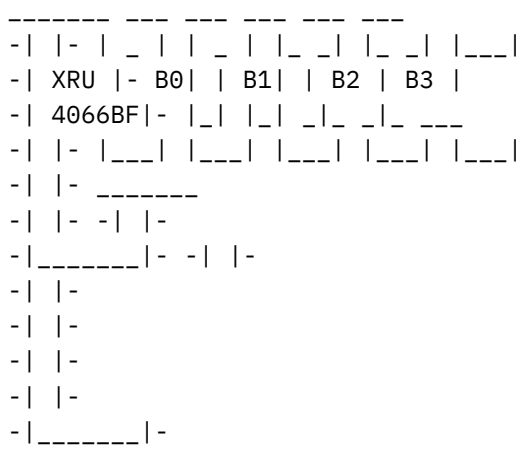
The cellular band is indeed missing.

ONLY Removing Jumper 1 (B2) is the MARS/CAP modification.

** Diagram of specified area on Control Board **

EDGE OF BOARD, viewed from the rear, looking toward front panel

Green jumper wires (B2, B3)



The jumpers are actually soldered on the other side of the board,
but the loops come up over the top and hang over the B0/B1 side.

B0=R414
B1=R412

Here's something interesting! According the Kenwood rep I spoke to,
performing this mod *does not* void your factory warranty. The same
goes for any Kenwood published service bulletin or modification info.
We are encouraged to perform the repairs ourselves to save them the

trouble and expence.

DTMF Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented).
The radio can also be externally DTMF controllable with an HT, but that
will be described later.

The DTMF control keys are exactly as shown on page 81 of the
manual. Note that the microphone is active all the time, so any
ambient DTMF tones near your mic will also change rig settings. This
includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory.
To enable cross band repeat from the front panel, first select a band
by pressing BAND SELECT. Then, change the control to the other band by
hitting [CONT SEL]. Next, press [F] for one second, then the "X" button
(far right side). Decimals will appear between the Kilohertz digits, and
the "ON" indicator will light momentarily. The microphone sequence to
enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by
turning on the radio with [LOW] pressed. They also recommend enabling
the Time-out Timer, for obvious reasons.

Note that the TM-733 can also be used as a "one-way" cross-band repeater.
For example, if you can receive a distant repeater with your HT, but have
difficulty getting into it, you can use the TM-733 to boost your transmitted
signal. To set this up, just omit the part where you "change the control
to the other band by pressing [CONT SEL]." Doing this will setup the TM-733
to repeat your signal to the other band, but will not retransmit the distant
station back to you. If this sounds ambiguous, play around with it a little
and it will begin to make sense.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with
the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63:
[PTT] + [DWN] + Power On). This feature supposedly lets you hear the
DTMF tones you are transmitting. The first problem is that it only

gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

(Updated information for Release 2.0):

Per Ricardo, a Kenwood technician, they are aware of this bug and are working on a fix. No details yet.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual frequency being generated. The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

(New information inserted into r2.0):

==========
Transmit PL Fix
==========

Kenwood just released a Service Bulletin to address the transmitted PL tone noise on the TM-733A. (Yeah!!) Call the Kenwood Service Dept. (1-310-639-7140) if you want a hardcopy. Here's a summary of the text. Use it at your own risk. If you are going to get into your radio with a hot iron, you should first get the real paper from Kenwood with the drawing.

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high level of distortion. This is easily seen when the incoming signal is viewed on an oscilloscope.

Countermeasure:

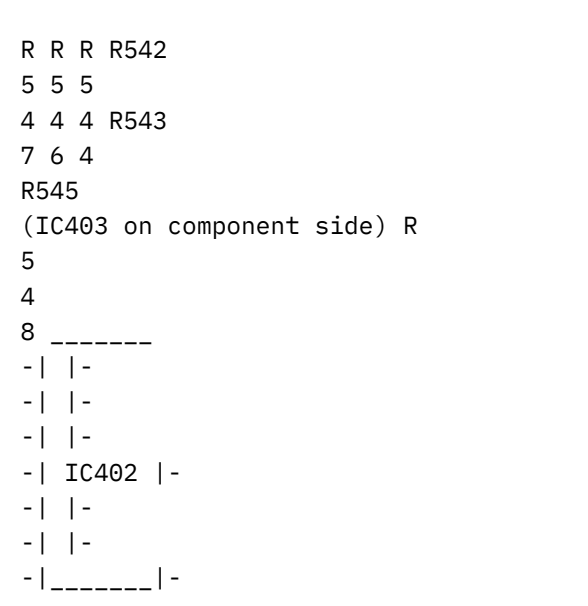
Change the value of the "Pull-up" resistors in the PL tone encoder circuit as shown in the accompanying chart and illustration. This reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k
R545	1.8k	6.8k
R546	1.8k	10k
R547	1.8k	10k
R548	1.8k	10k

Procedure:

1. Disconnect the power cable, microphone and antenna's, etc.
2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.
5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to the chassis.
8. Turn the circuit board over and replace the resistors using the parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View



Caution: This modification requires advanced surface mount soldering equipment that is rated for CMOS circuits. It also requires familiarity with advanced surface mount soldering techniques. If you do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance from your closest Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The dirty PL is definitely found on early models, but we have had many reports that the PL problem has been fixed in newer versions of the radio. If you purchased your radio after September 15, 1994, (or your serial number is greater than 55000000) it's a good chance that you may not have the PL problem.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different than DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will recognize this because of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating as a frequency agile remote base. Now Kenwood just needs a CW IDer!

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

-------------------------snip here and print---------------------------------

Nick England (nick@cs.unc.edu) wrote:
: Any advice and experience would be appreciated. Any other manufacturers
: I should look at? Is Aluminum better than Steel?

I'd stay away from aluminum towers AND masts. The metal fatigue that everyone hears about DOES occurr. A local ham had a 50 ft AL tower with a 3 ele 20M monobander a few years ago. Following a relatively minor storm with winds of only 30 mph or so, the entire tower SNAPPED off at the 4 foot level due to metal fatigue. Yes, he was WAY under the maximum wind load for this tower. The tower was up for about 5 years.

: I am considering spending some serious $$ on a crank-up tower.
: A) Yes it has to be a crank-up because of city zoning regs
: B) I've got some tall trees on a ridge I'd like to get over
: C) Motorized because it'll be some distance to the shack

: I figure I want to mount the following
: 1) Some kind of tri-bander, maybe with WARC coverage
: (because I am a casual DX'er but would like some chance
: at getting through)
: 2) a 5 el 6M beam
: (because I used to have fun on 6m years ago)
: 3) a ?? el 432 MHz beam for ATV
: (I'll remote the ATV gear in a garage near the tower to
: keep 432 MHz feed length down)

: adds up to around 10-16 sq. ft. depending on how many el the tri-bander
: is

One's antenna needs always change....and usually go up in size/quantity!

: I am considering the following:
: Hy_Gain/Telex HG-70HD 70' 16 sq.ft. @ 60 mph
: U.S.Towers HDX-572MDPL 72' 30 sq.ft. @ 50 mph
: HDX-589MDPL 89' 30 sq.ft. @ 50 mph

They all look like good choices.
Be careful and safe....know what you are doing and enlist some help from someone that really knows what they are doing. Talk to one of the local DX/Contest guys in your area.

Good luck!

: thanks,
: Nick KD4CPL

If you dont care about changing tones more than once, you can get the
SS-32SMP from commspec in orange, CA it costs 27.95 it is programmed
by solder jumper pads. it cant be beat for size & price.

In article <39rksn$25k@newsbf01.news.aol.com>, n7chs@aol.com (N7CHS) says:
>
Mocom-70 (VHF low band) and retuning for 10
>FM. Does anyone know how to read the Model # and decipher the operating
>band and power output.

The model number does not tell you the "split" the radio is in. You want a radio in the 25-30 range. Othwise band changing could be pretty involved which depends on your patience. Get a manual from Motorola before doing the work. It can be done, I've done it 15-20 years ago, so it's a blur now (in fact so is my keyboard).

Models:

U-Universal mount(can be front mounted)
5-Power level, depends on model and band)
1-BAND range 1-25-50, 3-136-174, 4-450-512, etc
b-receiver revision
b-transmitter revision
n-power source conversion(n="none")

a 51 would be about 60 watts or so. a 71 about 90, etc.

The exact power levels and model rx/tx rev numbers escape me, but I think you get the isea. You'll know if you're looking at a Mocom 70 then all you need to know is the power/frewq range(31, 41, 51, 61, etc for low band)

suffix numbers(4 digits) denote things like pl, etc.
basic radio set: 1000(carrier sq 1 freq)

ex:
3-PL squelch(1=carrier)
1-2 freq(0=1 freq)
0-sometimes frequency number(# of channels)
0-accessories such as "quick call", but sometimes pl info.

There is quite a range of possibilities when it comes to the suffix number. Suffice to say, if it start with a 3 it is pl. As for number of freq's look in the radio and see how many slots there are for channel elements or, in the case of the low band radio crystals.

I hope I didn't make this clear as mud.

Source record: 222828

Hi,

I got an TR 9130, a 2m allmode trx, looks some years old.
We want to modify it for FSK, but there's no doc. So, is there
anybody who knows where to fetch the signals (varicap for tx and
demod for rx), or maybe what the corresponding type for 70cm (430MHz)
is? Maybe it's possible to find a tap here for the 70cm type, because
it's more commom to do 9k6 at 430 than 144.

73,
Olaf

From: RUSH HEAD <U24129@uicvm.uic.edu>
Message-ID: <94316.121000U24129@uicvm.uic.edu>
Source record: 222832

HI!
For Sale:
Fluke State of the Art , top of the Line Digital Multi-
Meter Model 45 with all the options and accessories.

measures: ac/dc voltages, ac/dc current, dB, resistance, etc.

Other Features include:

5-digit display, true rms readings, memory storage, serial port with
adjustable baud rate up to 9600. Options bought with it were a built in
rechargeable battery pack, ieee-488 port for communications with other
electronics, and the quickstart 45 software pack, which gives you total
control of the dmm via ibm-pc compatable computer (via serial). This is
a die-hard unit, as the Fluke name implies, will last for many many years
to come.

Cost New:
$664.83 dmm
$209.09 ieee-488.2 interface (built-in)
$177.73 rechargeable battery pack (built-in)
$106.00 quickstart 45 software

____
$1157.65

This is the price in the new Newark Electronics catalog.

I'm asking $700.00 + shipping. Its only 9 months old and in great shape!
if interested please email direct to:

u24129@uicvm.uic.edu

thanks.

5695. HF amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-12 18:56:00 UTC
From: ernie.koch@freddy.supernet.ab.ca
Message-ID: <50.1199.2633@freddy.supernet.ab.ca>
Source record: 222836

Hi John,
-> I have been thinking about about getting a 5-watt QRP rig both for
-> use as a QRP rig (naturally...) and also as a backup for my standard
-> HF rig. For use as a backup rig, I would like to buy or preferably
-> build a solid-state HF amplifier that would take the 5-watt QRP rig
-> and give it something like 100 watts out. I would suspect that this
-> would be a rather common desire, but I can't seem to find such a
-> beast described in the Handbook or for sale in any of the catalogs
-> I've accumulated. Do they exist? Advice and ideas welcomed.
->
-> 73 - John, W3GOI

I think Kenwood had one that might be obtainable. Its been a few years
since I've seen it in there catalog, but its worth a shot. The only
other possibility is that you'll have to check at flee markets etc.
Another sorce may be Ten Tec. Check them out, you may be lucky.
Good Luck.

5696. Info of MOTOROLA 2-way radio

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-12 19:05:10 UTC
From: ejones@zener.cuug.ab.ca
Message-ID: <3a33l6$clp@zener.cuug.ab.ca>
Source record: 222815

I picked up a old (1970) 2-way radio at a flea market ($5). Seems like it works the 148-174 MHz range. (it currently receives the weather on 162.400 MHz)

I'm trying to get it to transmit (knowing that I still have to put TX crystals in). However, when I key-up nothing happens. After opening the unit up, I can see that it looks like its missing a jumper or maybe even a smaller daughter board for the transmiter. The connector is labled "XMTR MTRG".

The only model number I can find is on the mic "CTMN6019A". The chassis is labled "HH/MD33CMT-1170B". It reads "BUSINESS DISPATCHER FM 2-WAY RADIO" on the front. It has 4 Channels and a key lock on the front.

Does anyone have information on this transceiver?

5697. Help or Info re: Kenwood IF-232C Interface

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-12 20:33:17 UTC
From: ken@boxhill.com
Message-ID: <3a38qd$15l@boxhill.com>
Source record: 222816
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Dear fellow hams:
I recently bought a Kenwood IF-232C computer interface (@ hamfest :)
which I intend to use with my TS440SAT HF rig.

The IF-232C came without manual or docs.

I suspect it to be just a TTL <-> RS232C level converter, which is fine.

Can anyone:

1. supply me with docs for the Kenwood IF-232C?
(I'll gladly pay for duplication/postage costs)

2. point me to where I can find out about the serial ASCII protocol used
to control Kenwood HF rigs? All I know about this interface is that it
works at 4800 baud.

Thanks for any help anyone can provide.
I would appreciate a cc of reply postings to ken@boxhill.com, in case I miss it
in the newsgroup.

Also there is a company that advertises in QST called communication
concepts that sells parts kits of 5 in 140 w out broadband amps.
you supply the box, heatsink, and output filters, and maybe the
relay (depending on which model you buy.
The owner gave me extraordinarily good service when I screwed
up . The cost is around 90 bux.
Their fone # is 513 426 8600.
This was in the ARRL Handbook , I think it was the 1988 or 1987 edition.

I have been using for some time a GREAT keyer that has 4 memories that can be of random length...It is avail as a kit from Idiom Press...The keyer has lots of nice features , such as being able to input commands directly from the key...I am sure you will like this keyer! However, you must be able to put the kit together....It requires a box and knobs and a pot for speed control, these are not included in the kit..It is available from Idiom Press box 583 Deerfield, Ill. 60015..I think the price for the kit is $45...The chip is a computer all in itself and is CMOS and takes very little power....Has side tone capabilities....Which can be turned off be key command....Hope you will consider this kit..

5703. Explain "autorepeater" Please

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-13 01:19:06 UTC
From: aliberti@magnus.acs.ohio-state.edu
Message-ID: <3a3pia$7js@charm.magnus.acs.ohio-state.edu>
Source record: 222822

I am starting to look at mobile rig ads. Some boast an "autorepeater". I assume that you can access the rig from your HT for example then rebroadcast to another repeater.

Is this a feature exclusive to radios with autorepeaters or can the same thing be accomplished on other dual banders without the "autorepeater" feature.

Please explain.

Thanks- from a novice.

: I have been using for some time a GREAT keyer that has 4 memories that
: can be of random length...It is avail as a kit from Idiom Press...The
: keyer has lots of nice features , such as being able to input commands
: directly from the key...I am sure you will like this keyer! However,
: you must be able to put the kit together....It requires a box and knobs
: and a pot for speed control, these are not included in the kit..It is
: available from Idiom Press box 583 Deerfield, Ill. 60015..I think the
: price for the kit is $45...The chip is a computer all in itself and is
: CMOS and takes very little power....Has side tone capabilities....Which
: can be turned off be key command....Hope you will consider this kit..
: 73's James KI6JD

Although James didn't say so specifically .... this kit is the CMOS
Super Keyer II described in QST (Nov 90??) and I believe in the handbook.
It is also sold commercially as the Logi-key .... and it IS wonderful.

From: joopv@etprs.phys.tue.nl
Message-ID: <joopv.784739866@etprs.phys.tue.nl>
Source record: 222829

I have the problem that i can not make any more deviation than about 2.5kHz when injecting audio at the 9600bd input from the TM733.

When i inject more than approx. 900 mV eff (this produces 2.5kHz dev.) the modulation becomes very distorted.

The s/n of this TM733E is 51103886.

Also the bit error rate is very high when using 9600bd.

Anybody recognizes these problems ?

Joop, pe1dna

Be careful - a tower rated at 50 or 60 mph is a tower with no rating at
all. Nowhere in the US is the maximum wind under 70 mph. So before
installing anything, get a MEANINGFUL wind rating from the manufacturer.
There are charts available showing the maximum wind in you area. Get a
copy of the Rohn catalog, if you can't find it elsewhere.

I'm not sure which element the M-3 is but there are four standards used
for the microphones used in avionics headsets. I don't have a David Clark
catalog anymore but here it goes:

Carbon - Approximately 50 ohms DC resistance and requires approx 50 ma
bias current. Output power is up to one milliwatt but they
tend to be noisy. Been standard since WWII.

Carbon Replacement - These modules (David Clark M-1DC) are intended to
replace carbon elements with modern low noise dynamic mics and
contain a built in transistor amplifier which makes the entire
assembly 'look' like a carbon mic. Requires a few ma (50 is ok)
bias current and will operate fine from many modern radio mic
inputs which provide bias for an electret mic/amp.

5 ohm dynamic - These are the standard now used in military aircraft. The
elements have a nominal output voltage of 800 microvolts and
normally drive a transformer for ground loop isolation.

100 ohm dynamic - Also used in military applications but i've never seen
them and don't know where exactly.

>
>Anyone have any ideas?

Use a impedance step up transformer. I use a generic one from Radio Shack
to drive the mic input on my TS-120S and it works ok. The fidelity isn't
all that great but thats inherent in the microphone and not the transformer.

I have read some Astron power supplies can damage some rigs in particular HF rigs. Has anyone had problems running Astrons with a HF rig?The Astron tend to feed back alot of RF into the rig thinking it is not getting enough voltage so the Astron sends it more voltage and ends up zapping the rig??

5717. HELP!!! What do I choose? I need a dual band mobile!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-13 21:27:26 UTC
From: justinb@psg.com
Message-ID: <1994Nov13.212726.26246@psg.com>
Source record: 222747

Hi there,

I am considering purchasing a dual band mobile radio. I was hoping
that someone out there could help me decide which dual band mobile to choose.

Here are the options I see so far...

Kenwood TM733a
Icom IC2340H/IC2700H
Alinco DR600
Yaesu FT5100/FT5200

I would like to know the pro/con's of what you feel on each radio. So far I
would pick either the TM733a OR Yaesu FT5100/FT5200. Kenwood because their
face comes straight off without diconnecting any wires, and Yaesu because of
the backlit keypad.

Please help me out...
Thanks,
Justin Bousquet

Get the strongest your wallet can afford.

Be very careful fooling with crank up towers. Sure, they
have safety features, but when you climb it...put it in the
down positions and "lock" it together with 4 x 4 block.
You do not want you toes or fingers cut off.

Also, have you looked antenna fuses? By antenna fuses, I
mean rotators. Rotators are a big pain the butt. Don't
believe the specs...they usually lie.

For the multi-band...I would look at a Mosley or Hy-Gain.
Depending on your climate..the Mosley beams are usually
bullet proof and will take a lot of abuse. Telerex are the
toughest, but who can afford them.

If you have any specific questions, let me know directly.
I have done too much tower work and can save you a lot of
headaches.

3 element 80mtr beams are neat...when they work!

Source record: 222749

Troyce,
why don't you go for the little AT 150? It's the companion of the IC 735
and can be easily converted to be used with any rig. It just needs a control
voltage on one of the pins on the accessory connector for the band selection.
I've been using mine for a while with my 830 and works great. To generate the
control voltage I've modified my homebrew keyer but I'm sure it's possible
to work out a solution to get such voltage out from the band selector.
If you are interested in details let me know and I'll take a look again on
my ICOM user manual.

The TM-733A has a known problem with the CTCSS (subaudible) tone encoder.
Apparently, the tone generation technique results in a very distorted
waveform. This was posted and discussed on the net some time ago.
The problem may have been resolved by now...I don't know.

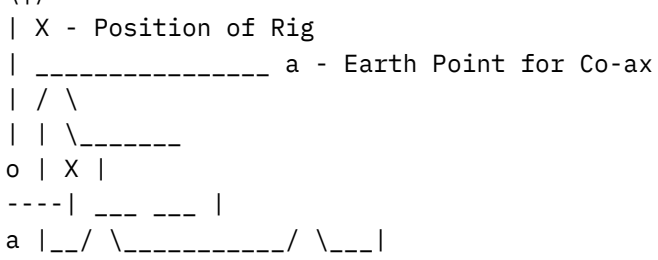
I have just installed my FT900 in the car. I am suffering however from S7 QRM and am wondering
if there are any FAQ`s or anyone has any advice on what to do to clear it up.

From my preliminary investigations it looks to be the Engine Management System as the QRM starts as soon as I turn the ignition key to the first position i.e before the engine is started.

A few details about the installation. The car is a HONDA CIVIC Esi (equiv to a US Si). The antenna
is a G-Whip Flexiten mounted via a horizontal plate underneath the trunk. The Co-ax feeding the mount is earthed at the mount point to the plate. The rig is mounted in the trunk. There is an
Earth connection to the Rig from the car chassis and is approx 12Inches in length. The power is
supplied via the recommended cable straight from connections to the battery terminals.



Any Thoughts

Robin

5729. Kenwood TM733 questions

Hello;

Does anyone know if the Kenwood TM 733A can act as a in-band repeater? They advertise that the machine can act as a cross band repeater, and that the machine can dual receive in band (UHF - UHF etc) . Is it possible to make the machine receive and repeat on the same band? Is there a mod to do this? Can it do it out of the box?

Any other random comments about the 733 before I blow my budget on it?

Thanks,

: the rig??

I've not heard of this one. I have the 35M and RS50. I have a Yaesu
FT-890AT on the 35M and a 2 meter all-mode with a 100 watt linear amp on
the RS50. If you have ever looked at the diagram on your power supply it is
pretty well bypassed. If you are afraid of this happening, put a toroid
core
(2" or 3") at each end of the DC power lines and one on the AC line as close

to the power supply as you can get it. Just loop the leads about 4 or 5
times
through the core. Don't put more than that on the DC side because you might

cause some heating in the turns if your power leads are small enough.
You might even put a .01uf 50V ceramic cap across the DC output on the
supply.

Hello, Doc. I've tried for several hours to get my TM-733 to do inband cross-band repeat, but will not. I've tried hundreds of front-panel key combinations (While in VHF+VHF or UHF+UHF mode). Also, when in this dual-receive mode, simply doing to cross-band repeat enable keys yeilds a dull "you can't do that" beep!

I doubt there would be an internal mod to this, but if you find out something, post it here on Usenet.

What I REALLY like about the TM-733 is that it's a frequency agile remote base. Radio functions has be controled remotely via an HT -- even enabling and disabling of the cross-band repeat mode. With this handy stuff, it's just like having a remote base on a mountain top - except it's at my house!

73 for now...

Subject: Help! Com port/tnc/rs232 problem
From: ablackbelt@aol.com (ABLACKBELT)
Date: 13 Nov 1994 23:20:30 -0500
Message-ID: <3a6oie$e9o@newsbf01.news.aol.com>

Help needed on solving the problem of multiple serial port connections. My
last computer had a parallel mouse and left just enough room. Anyhow
problem is this......
Mouse is com1
internal modem is com2
I know that Com1 and 3 share same irq and 2 and 4 share same irq. I
bought a serial card that has addressable com ports. I have the serial
cards two external ports set to Com 3 and com 4. The mouse has its own
connection off of another board as com1. If I put the kam+ tnc on com 4
then there is no conflict between the tnc and internal modem as long as I
don't use the modem. So far so good.
Now I have this rs232 interface from Kenwood which I think needs a com
port to control the TS850 for the logging pgm etc. If I hook it to com 3
then since the mouse is always being used won't I have a problem. As I
mentioned the last computer I had (lightning got it) had a parallel mouse
(or some other than serial because it did its own thing on a separate
board). I think I have the comport info correct but I really need help on
this one! I don't think any of the devices uses a lpt port so what do I
do? In a nutshell how do I connect a tnc, rs232 computer/rig interface,
mouse, and internal fax/modem so that they coexist without conflict. I
remember that my pkgold pgm allows you to address the com port thru
software. (I have been off packet due to the lightning strike to the shack
for over a year now) The extra addressable serial card provides some
flexibility but I am still in a fog! HELP PLEASE! FROM A FRUSTRATED WANNA

I've been using Astron supplies both at home (RS35M, RS50M) and in repeater use
(RS35M, RS35M/BB, RS50M) for years. Wish everything I had was as reliable as
the Astron supplies.

Had one site built around a cheezoid power supply. High RF environment. We
put in an Astron supply, and a LOT of the problems went away-

A power supply cannot "feedback RF" into anything.

What it can possibly do is go out of regulation due to the
RF getting into the regulator's comparator's circuits and getting
rectified there. Then this error voltage causes the power supply
to go out of regulation, possibly going overvoltage.

What swr does the meter read? It won't do anything if it is below
an adjustable set point. Maybe someone set it too high.
When both switches (antenna tuner inline and tune) are depressed,
it will go into cw mode and put out 10 watts. Does it do that?
Place the meter switch in "swr", set the vox switch on, go into
cw mode and press send...read the swr. (full pwr here). Release,
the send switch and change the position of the tuner inline switch
repress the send switch. You should get a different swr reading.
By the way, when it finishes tuning, you have to release the tune
switch or it will sit there putting out 10 watts (the xmt red light
will be on).

: : Dave KA2FYX...........

Get it from Yaesu, or HRO carries them. I did find a connector at
radio shack. It's a (CMC) special order 4mm adapter that I soldered wires
to. But after a couple of days it wasn't making good connection in the
radio. It wasn't falling out, but the radio would turn off and I would
move the cable slightly and it would turn back on. Since then I purchased
the connector and cable from HRO, and it works just great.

So, Stick with the manufactures cable.

From: dgf@netcom.com
Message-ID: <dgfCz9xLD.6K2@netcom.com>
Source record: 222783

Now that I have my new intermod receiver in hand (aka Standard C108A mini HT), I'd like to get it to receive the 2M ham band as well as it currently receives intermod.

I'm envisioning a small bandpass filter that passes 144-148 MHz; it doesn't need to handle much power at all (the intermod receiver can transmit also; it puts out around 1/4 watt). I'd install it in the coax between the car's 2M antenna and the intermod receiver. I don't want to build one for lack of time and test equipment.

Any suggestions?

5750. Dead 440 tx in my TH-78 - HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-14 21:31:31 UTC
From: c594911@showme.missouri.edu
Message-ID: <3a8kvj$6o4@golf.ustores.missouri.edu>
Source record: 222787

I have a Kenwood TH-78 dual bander that seems to have dead finals
on the 440Mhz side. It transmits at 440 but only at very low power.
The 2m side is perfectly fine. It seems like I have it set to EL
power output (20mw) all the time, even when connected to 12v supply.
It should yield upwards of 5 watts at 12 volts.

Has anyone ever fixed a similar problem in a TH-78? Are the final
amp transistors seperate from the 2m side?

Any ideas/help/suggestions would be appreciated.

tnx...

I am the proud owner of two Astron supplies (20M & 35M). Both are
connected to my repeaters. One is only 2 years old the other 7 years.
Never a problem with either one. Considering the amount of RF near these
units they are terrific! I have never heard of this concern before and
really feel its unwarranted.

My favorite 2m rig... 10w on Hi, 15kHz spacing, 146-148 MHz, 22 switchable
synthesized channels, diode programmable. Good sensitivity without intermod.

With a kit from TechnoLogic Concepts, it covers 144.62-148 MHz, 5kHz spacing,
over 650 thumbwheel selectable frequencies/channels.

If it already has the TechnoLogic Concepts kit, it is worth $125. Otherwise,
it is worth about $50-$75.

Of the dozen+ Astron supplies I've bought, none of them came with
a manual - just a purple warranty card sheet and a schematic. However,
the last Astron I bought about a month ago had a real booklet for
a manual, had a lot of good information in it including troubleshooting,
how to parallel two power supplies, etc. It came with an RM-50M,
but from the looks of it, it will probably be included in all supplies
in the future.

> Help! On A Yeasu FT 530, I need to know the size of the DC power input
> connector, they have an outside, and inside diameter in milli-meters.
> My friend tells me his manual says 4mm outside on one page, and 3.5mm
> outside on another page! With no mention of inside diameter!
> He also said he tried every one that Radio Shack sells, but none fit!
> Can someone out there shed some light on this.......Thx....

Yaesu, in their infinite wisdom, used a non-standard, (and proprietary it
seems) power connector on the FT530. I lookid high and low, and found
noone that manufactures the D*** thing.

Fortunately, I walked into my local HRO & they had them in stock. If I remember
correctly, the connector with 4 or 5 feet of cord attached (the only way it's
available) was about 7 or 8 dollars. Yep, more than a bit more than a buck
for the connector at RadioShack, but it fits and won't damage the radio....

If you're thinking of hard wiring in a car, get the auto adapter, as it has
a filter built into it.....

Measurement with a caliper shows the base (straight section) of the connector
is 0.158 inch, and looking into the connector, there's a two prong contact.
As near as I can guesstimate, the center pin on the radio is about 0.045 inch.
That'd make the connector 4.01 mm outside dia, for a 1.14mm pin. Not exactly
a standard. Note that the connector is sort of "barbed" for insertion and
retention in the radio, so a straight connector (if you found one) might not
make an adequate connection......

Good luck! Hope you find one somewhere.....

I worked part time for 6 or 7 years at a ham store fixing rigs, including a tremendous amount of Kenwood and Icom transceivers, as well as a great deal of Astron power supplies of various sorts, and have never encountered the problem of the Astron blowing up the rig for any reason, and certainly not due to any RF feedback. (It looks like the majority opinion on this question is that no one has ever heard of it happening.) 73 DE WA8MCQ

In article <3a33l6$clp@zener.cuug.ab.ca>, ejones@zener.cuug.ab.ca (Endaf Jones) says:
After opening the
>unit up, I can see that it looks like its missing a jumper or maybe even
>a smaller daughter board for the transmiter. The connector is labled
>"XMTR MTRG".

>chassis is labled "HH/MD33CMT-1170B".

That connector is for transmitter metering, nothing that is part of the radio plugs in there.

Usually Motorola radios have a heavy red and black wire for connection to battery, and an orange
and a green wire to run low level stages. It could be that one of these is not connected to power, or
the radio may switch with a reed relay which is very quiet. Not familiar with the D33CMT specifically.

Once Upon A Time (about 10 years ago), there was an Astron model that
was susceptable to a strong signal on 40 meters. The failure was bad
for the power supply, but didn't hurt the radio. Seems like the fix was
a new 723 regulator and an additional 0.1uF cap.

From: dcameron@unixg.ubc.ca
Message-ID: <3a9flh$k3j@nnrp.ucs.ubc.ca>
Source record: 222698

: I guess the commercial equipment coming on to the surplus market in the
: States is quite different to the stuff we get over here, but if it's of
: any use, there is an excellent book by Chris Lorek, G4HCL called 'Surplus
: 2-Way Radio Conversion Handbook', published by Argus Books,
: ISBN 0-85242-946-0, which deals with the conversion of Pye HF/VHF/UHF
: equipment to the various amateur bands.

I found a Yeasu commercial band radio that could be programmed into any frequencies from 130-174 MHz. I picked it up for $50 from a local buisness that moved over to cellular telephones. The radio is a mobile and it used to transmit in the 171 MHz commercial band here in Canada. All i did was go to my local candy store and ask them to order the manual in for me. It cost me about $20 for a full service manual and modification pointers. I know that not all people have the knowledge of tuning so just take the radios to your local techy to tune em up.

I would suggest staying away from radio which are crystal controlled. They are too expensive and limit your ability to expand your radio. I found this Yaesu FTC-2640 8-channel programmable rig. It is programmed using a diode-matrix truth table. In layman's terms, In an hour I could have a different set of channels in there for the price of 30 small diodes. I also designed a modification for it which allows me to switch the diode matrix from outside the radio. I find it great for travelling so I can input the local repeater frequency withoput opening the radio.

It has about 75 watts true FM power output. Awesome receive sensitivity and NO INTERMOD. I think it by far the best investment I have made as far as radios go!

I recently bought and installed the above named wire and have had a hell of a time getting the thing resonant.

The wire feedpoint is on a 40' pushpole, mounted to my fence. It has a copper ground rod next to it so the ground is solid and good. I have the ends at least 12' off the ground. I have had to trim 20' off the 80m leg to get it resonant, 15' off the 160m leg to get it resonant and the 40m leg is still 8-1 swr as I haven't tried chopping a ton of wire off that lkeg yet and minor adjustments don't change the swr at all.

Has anyone any experience with the Alph Delta DX-A that can comment?

5772. Low Power Receiver for Solar Repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-15 13:41:20 UTC
From: Tony.Komljanec@banyan.dgim.doc.CA
Message-ID: <M1g8+osAoia@banyan.dgim.doc.ca>
Source record: 222547

Dear NetHams:

I'm looking for a low power quality VHF receiver to use in a solar powered repeater. Before I purchase/barter/trade for one, does the networld have advice on a model or particular type of RECEIVER I should be looking for?

Specifications (in order of importance):

* Operates without modification at 147 to 148 MHz (proper split).
* Must be stable from -40 to +50 C and meet commercial type approval specs within this temperature range.
* TCXO
* standby current consumption of 50 mA or less
* Sensitivity for 12 dB SINAD of -117 dBm (0.3 microvolts)
* Usual commercial selectivity of 60 dB@30 kHz or better (amateur products need not apply)
* Easy audio and COS interface
* Some form of hysterisis squelch (noise gate, like Micors/or variable gain stage, like Daniels). This would be nice!
* Preselection and/or good mixer TOI characteristics (duplexer takes care of this to an extent).

The receiver will be used at an existing (VA3PLA) Solar powered amateur repeater 150 miles northeast of the Toronto area. The site is on top of a hill, and the temperature/weather can range from hot (100 F) in the summer to cold (-40 F/C) in the winter. Most of the time, the repeater is in standby, so it is desirable to minimize this constant current consumption. Other specs noted above are consistent with a repeater application.

Someone suggested that a Motorola MX300 receiver would be suitable. A Daniels receiver would certainly be good, but since we havn't won a lottery, it can't be afforded. This is a shoe-string budget affair. Any suggestions or recommendations for a suitable receiver would be appreciated.

Regards,

Tony Komljanec, VE3PEP

The 210X didn't cover 160 meters. That was the 215X. And neither would approach 250 watts output, more like 70-80 watts. These radios were among the very first ultra-compact solid state HF rigs (1970s). They suffered all the ills of first generation solid state equipment. The *collector* value of this old radio *might* approach $500, but that's a lot more than it is worth as a radio you'd want to *use*. For $500-$600 you can find a used IC735. That's a radio with modern performance.

>dkelly@nebula.tbe.com

My experience with Astron 35M has been excellent.
I have Kenwood TR9000 (5, 14W) and Alinco DR-120 (?) (5,45W) and
indoor dipole antenna hanging on the wall, Lambda power supply (12V, 10A)
(I completely modified the regulator circuit using 723 because the regulator
was bad and could not get the part), Astron 35M, Radio Shack PS(3 or 5A).

1. TR9000 and Radio Shack/modified Lambda PS.
5W ok, but 15W have a some hum (actually it is RF feedback).
If I changed a microphone (from DTMT mic to plain mic, both
made by Kenwood) or location of the mic or antenna or touch
the ground, it cures the problem.
2. DR-120 and Radio Shack/modified Lambda PS.
5W with both PS is ok, but 45W with Lambda has a severe RF feedback.
I tried to put some various capacitors across the PS line, but
it did not work. If I touch the ground, it worked depending on the
physical layout of the antenna, mic cord. I measured the PS voltage,
the is jumping down whenever transmitting.
Now I am using DR-120 with Lambda and a few sets of RF interference
ferrite in the antenna (using two tubular type and one rectangle type),
this combination does not have any RF feedback.
3. TR9000/DR-120
with Astron 35M. This does not give any RF feedback. But this supply is
too big in my room.

: A power supply cannot "feedback RF" into anything.

: What it can possibly do is go out of regulation due to the
: RF getting into the regulator's comparator's circuits and getting
: rectified there. Then this error voltage causes the power supply
: to go out of regulation, possibly going overvoltage.

Very true. The problem is not the power supply or the radio, but in the
antenna, feedline and grounding system (or lack thereof).
A well-working antenna system (low SWR, well-done connections and
good ground system) will help prevent the RF problems.

Whenver I have a power supply problem on HF, it is usually due to an
antenna system problem.
Usually on a new, untried antenna that needs some help :-)
I don't have an Astron, but a cheapo import (Pyramid), that works nicely.
However, these imports may vary in quality, so investigate before buying.
I have no experience with Astron, but hear only good things.

I had the same problem finding the right connector, but I found out that
you can
get it from Yaesu or a store such as Ham Radio Outlet (that's where I got
mine).
HRO wants about $9 for it. So if you can find on else where cheaper then
goodluck.

What is it? Sounds like a multi legged sloper. A ground rod is not an RF
ground. If it's a 1/4 wave antenna, you need some ground radials.

5784. Battery Question: Yaesu FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-15 17:46:48 UTC
From: Paul Antaki <pantaki@prodigy.bc.ca>
Message-ID: <3aas68$qbu@prodsql.prodigy.bc.ca>
Source record: 222711

I bought an FT-530 a few months ago and I started noticing that my
battery (the standard one) seems to die very quickly when left attached
to the unit. In a matter of a day or two a fully charged battery is
discharged without using it at all if I leave it attached to the FT-530
(off of course without anything on the display). Is this normal?

Many Thanks,
Paul

I think "autorepeater" means the rig will set the proper repeater offset
depending on where you are in the band. For example, if you tune to
146.76, it will set the offset to -600.

I heard that there might be a schematic floating around that will allow you to convert a modem into a TNC. Does such a thing exist? I'm just starting to get into Packet and I'm about to come into about 6 Hayes 1200 Bd Modems (internal) , and a couple of 2400 modems. and this would be an interesting project to work on, not to mention saving me much $$.

If there's any good reference material on this subject could someone point the way?

Thanks

Hi Paul. I have the standard battery for mine also (but I'm hoping to get a
couple of large capacity ones.) I leave it attached to my radio all time.
Mine doesn't discharge when not used (any more than any other nicad). I've had
the battery on the radio for a week or two without recharging. I'd suspect
your battery is having some problems. How much use do you get out of it when
the radio is on?

5794. ALDA tribander transceiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-16 00:37:00 UTC
From: nyoung@nova.wright.edu
Message-ID: <1994Nov15.193700.28204@nova>
Source record: 222733

Simple question: In a vain attempt to keep from building a three band hf rig for mobile use, I have approached a coworker about buying his ALDA 103. It's a 3 band ssb/cw rig from about 1980s, maybe. I can't remember when I last saw an advert for one. It looks a lot like an ATLAS and given the address on the partially complete manual that exists for the radio, I think it came out of a building right next door to ATLAS.
Anyway, it's got three band (80, 40, 20) and only 40 & 20 put out a signal. The RIT is a capacitor with a wire routed to the VFO cktry. The RIT runs on receive and tx, so that's another problem. Also serious dial backlash and slip. Oh, and broadcast breakthrough on 40 meters in the evening.

Any suggestions on how much this radio might be worth. I want to get around to serious discussions before Christmas.

Message-ID: <1994Nov16.012103.16604@newsgate.sps.mot.com>
Source record: 222736

I went through with a similar project earlier this year. I, too, wanted multiple antennas on a crankup. Mounting antennas on the telescoping tower sections was out. But proper antenna spacing is important. This led to the use of a tall mast on top. This in turn led to high stress on the tower. 20 sq ft at the top of the tower does not mean you can put the same on top of the mast.

My requirements included:

12 sq ft HF beam located 1 ft above the tower,
70 cm yagi located 8 ft above the HF beam,
2 m boomer 17B2 at 13 ft above the HF beam,
10 ft long KLM ATV beam, vertically polarized, at 17 ft above the HF beam,
Larsen 2/70 mobile vertical with added radials at 21 ft above the HF beam.
(don't laugh; this small wind load makes it far superior to a
fancy gain vertical down on the house. Go for height, not gain!)

So far I have installed all of this except for the non-ATV 70 cm beam. I am pleased so far. I would not accept smaller antenna spacings! Why pay for, and support, an antenna only to lose part of the gain due to spacing? Smaller antennas often tolerate smaller spacings better.

Realize that a rating for 50 mph means little if you have to design for, say, 70 mph. My city is very strict and requires 70 mph and adherence to the UBC. They don't recognize EIA calculations, even though the UBC text itself supposedly suggests the use of specialized calculation methods, supported by reputable organizations (such as the EIA !?) for specialized types of structures (such as towers !?).

I looked in particular at US towers and one model of TriEX. I also obtained information from most other manufacturers.

My local registered engineer (mandatory in my location) determined that the TriEX calculations were actually incorrect in places, making the tower look stronger than it was. (This was for a 60 foot, heavy duty model.)

The U S Towers calculations fared better for honesty, but beware of the differences that may exist between different engineering firms contracted by the company. (The company has no internal engineering capability.)

The tall mast meant I had to settle for a 55 foot tower. (The economic implications also turned out to be bigger than anticipated.) As it is, the tip of the top antenna is at 80 ft.

The U S Tower medium duty 55 ft tower at 70 mph turned out to support about 0.5 sq ft (without mast)!

The heavy duty 55 ft model was good for about 5 sq ft.

I ended up getting a custom design which is basically a HDX-572MDPL with the top section removed and with extra reinforcements in the bottom legs. Bruce at U S Towers was very helpful in getting the custom model done. (I got to pay dearly for design though.)

Because of the crankup, I could not use hardline. For ATV and 2 m boomer I used CQ 1009 flexible cable from the Wireman.

The mast is the heavy 20 ft from U S Tower, supplemented by 4 ft TV mast on top. The ATV works great, but suffers some from sidelobes. I am thinking about replacing the top section mast with fiberglass.

73,
Erik WU7O

Just arrived in the mail: Catalog 1094C from Tucker Electronics.

Check out page 22 where they attempt to get the unsuspecting monitoring enthusiast to buy the OPTOELECTRONICS DC440 CTCSS/DTMF decoder ($259.00) ...

"Continuous Tone Coded Squelch System or CTCSS as it's commonly known is being used by more and more non-trunked VHF/UHF two way radios and public service agencies. What CTCSS is, is a sub-audible tone that is encoded in a radio signal."

Ok. Nothing really wrong with that. Read on...

"In order to hear the transmission your scanner or receiver HAS TO HAVE this tone frequency programmed in. This is why you can program many police frequencies from your scanner directory but still hear only silence."

Do you believe this SHIT!?

I'm sure that the DC440 is a fine product but to use the BLATANT LIES above to get the unsuspecting scanner owner to purchase one is false advertising at it's worst!!

>HF rigs. Has anyone had problems running Astrons with a HF rig?The Astron
>tend to feed back alot of RF into the rig thinking it is not getting
>enough voltage so the Astron sends it more voltage and ends up zapping
>the rig??

For what it's worth...
Perhaps the damage reports you heard about was from Ten-Tec radios. In most cases, the power supply is their only SWR protection. When the SWR goes up, so does the power supply current. If the current is too high, the power supply should trip off to protect the output final transistors.
If you used a (reliable Astron) 20A power supply on a Ten-Tec Century II rig which should trip at 7 Amps in a bad SWR situation, the power supply would smoke the finals, reliably.

Hi

Has anybody had any experiance with the Icom 2700A/H. I have
not seen any comments in the news group about it. I am thinking
of bying one but it is a little expensive ($800) and I was wondering
what kind of problems experiances that people have had with it and
do they feel its worth the money.

Please post your comments or send me mail directly.

Thanks for the help

Just write a letter to Gettysburg explaining how you lost your license and request a duplicate. I would also request a Form 1010-B verification letter. This will arrive in 1 - 2 weeks and allow you to operate until you Form 660 arrives. There are no fees I am aware of.

>handle it?
>

I would be *very* careful about running any solid state rig at anything
over 2:1 SWR. Short transmissions probably won't hurt anything but long
tranmissions and continued use may very well cause component failure.

I might suggest getting some type of antenna tuner. If you don't plan
on getting any type of linear then something that can handle about 300
watts should be sufficient. I use an MFJ Versa Tuner III with my IC735
and Ameritron ALS600 don't seem to be having any trouble.

5813. Running Solid State at HI SWR

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-16 18:29:26 UTC
From: ham@wam.umd.edu
Message-ID: <3adj26$m6n@cville-srv.wam.umd.edu>
Source record: 222732

I believe that many out there don't know WHY high SWR can kill your
transmitter's finals:

Transistors dissipate power - everyone knows that. That's why, even
in perfect conditions (1:1 SWR) your finals get warm. Heat is the
enemy of transistors, above all else.

So what's the big deal here? There's alwayts a voltage drop across the
collector-emitter junction. There's a current flowing. P=V*I.
So the transistor dissipates it as heat.

Now take a poorly-matched load - some of the power that's supposed to
be going out the antenna is reflected back into the finals, and the
power's got to go somewhere (heat!!!).

Which is why a "foldback" scheme is used if hi-SWR shows up. Less power
into the anteena means less power dissipated in the finals as heat.

Yes, you can run a transistor into an open load or a dead short IF
the power is limited (a short is dangerous, tho), but run a transistor
at its full rated power into an open circuit and POOF.

5816. FT-530 cross band reception poor--normal?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-16 19:38:57 UTC
From: kreifels@intel.com
Message-ID: <kreifels.785014737@fmwu23>
Source record: 222731

I have a Yaesu FT-530 a couple months old, and have seen something peculiar when listening to a VHF station on the UHF side of the radio. The signal quality and strength are considerable less on the UHF side (by about 3 S units) when I dial the same frequency on both sides. Is this normal? I like to use this to listen in on a conversation while scanning other frequencies.

Also, the manual cautions not to have the opposite channel tuned to your transmit frequency when transmitting. Does any one know what is a safe spacing here? i

Would appreciate any suggestions.

>and a green wire to run low level stages. It could be that one of these is not connected to power, or
>the radio may switch with a reed relay which is very quiet. Not familiar with the D33CMT specifically.

Georgec - please watch your line length - many of us are using 80 column terminals.

You are correct about the power wiring, but you are describing a trunk mount radio. The "D" in "D33..." indicates a dash mount. I'd look for a Molex-style connector on the left or right side of the radio, somewhere near the front. I haven't been inside a 'CMT in 10 years. I can tell you that the 1170 means:

1=Carrier Squelch (3 in this position=PL)
1=Narrowband (+/- 5khz dev, 0=+/- 15khz dev)
70=multichannel - I forget the exact details except it's an unbalanced combination. 00=1freq t&r, 10=2ft, 1fr, 30=2f, 90=4f.
It's a vague memory, but 70 _might_ be 4ft, 2fr.

I seem to remember that the Metrum mobile shared the same power plug.
If so, it's 6-pin molex.

Mike Stramba (mike@io.org) wrote:
: Is anyone familiar with the Atlas 210x HF xcvr?

It was state of the art in its day, which was about the mid 1970's.
I got one a year and a half ago and used it while operating as YN1ASW
in Nicaragua last year.

: I'm going to look at it tomorrow night. The seller is asking $500.

I think that price is about 2X too high.

: It is a solid state unit that will run on 12v, has 250w of transmit power,
: and covers 10 - 160 meters.

You'll be lucky to get 100 watts out at 13.6 volts, and it will be
less at 12 volts. The 210x covers 80 - 10. There was a very similar
model, the 215x, that covered 160 - 15.

I liked that rig, it is still waiting for me in Central America, but
it was not trouble free. I had nasty problems with spurious
oscillations in the final on certain bands as the power level was
increased. This seemed to depend upon the match to the antenna. I
ended up being very cautious about operating when my housemates wanted
to watch television.

Hi Alex, your 1200 baud Hayes modems are probably the Bell 212 standard
which, to the best of my knowledge, are not used for RF. The Bell 202
standard is used for some VHF packet but I doubt that the above mentioned
modems will do Bell 202 which is FSK 1200/2200 Hz compared to the 4DPSK
of the Hayes 1200 baud modems.

The ARRL Handbook has a good writeup on ham modems in the digital
communications chapter. Let us know if you have any luck converting
Bell 212 modems for ham use.

This happens with mine also, and I think it's normal. I find the dual
in-band reception is useful only for local repeaters and other strong
signals.

> Also, the manual cautions not to have the opposite channel tuned
>to your transmit frequency when transmitting. Does any one know what is
>a safe spacing here? i

Feedback is the biggest problem. I did this accidentally one time and
generated a horrific squeal on the 147.135 repeater here. I don't
think a short burst will hurt anything but your eardrums, but don't
make it a habit. As long as you don't hear the outgoing signal on the
other side, you're OK - you may have to stay about 30-50 kHz away from
your signal or the repeater output.

This was also the same evening I found out it's not a good idea to
fool with the cross-band repeater functions using memory presets that
have the local repeaters stored in them.

Heh.. Y'all just made me check my battery voltage. It's the standard
FNB-25 (7.2v 600mAh) shipped with the radio, and it's been attached to
the unused (and uncharged) FT-530 for almost three months now.
(expensive clock?) The battery voltage reads a stable 7.5v right now.
It was used for a while before I put it in the drawer too.

Ne> Also the bit error rate is very high when using 9600bd.

Ne> Anybody recognizes these problems ?

Ne> Joop, pe1dna

Sorry, no answer... just the information that I plugged a Kantronics
KPC 9612 into my 733. "Out of the box" deviaton was 2 kHz, and I had
no trouble increasing that to 3 kHz (more if I wanted it). It's making
connections just fine.. go it's not a general problem.

Good luck,

Your asking too much for "in-band repeat." Think about it... a 50 watt
two meter transmitter operating in the same box as a 2-meter receiver.

Repeaters accomplish this with separate transmitters and receivers, well
shielded from each other, and a large duplexer allowing them to operate
into the same antenna. Without all this hardware, the transmitter
interferes with (or "desensitizes") the receiver.

Our club operates one repeater built from an old mobile phone, so the
receiver and transmitter are in the same box -- but it's a pretty big
box, and the receiver and transmitter are well shielded. Still, we had
to limit the repeater's power output to about 20 watts, and we are using
a large, external duplexer.

The dual-band radios can do "crossband repeat" because it isn't that hard
to filter the transmit RF several hundred MHz away from the receiver.
Filtering that RF just a few hunderd kHz is a much more difficult feat.

After looking through the latest CQ and reading K4TWJ's review of this rig, my only impression is: I WANT ONE BAD!! Before I do anything rash, I thought I'd solicit opinions from the net at large - is it really as awesome as it sounds? A friend said it's around $500 which seems very reasonable to me. I'm in an apartment, and a nice all-band seems like it would be great, and fun for portable operation. Not to mention the incentive I need to get my General! :-) The big reason I'm a Tech+ is because I bought an HR-2600, which I love. High-power HF operation doesn't really grab my interest.

: Has anyone gotten their hands on the new Index Labs QRP rig? CQ mag.
: really drooled over it in November. I would be interested in a 2nd (or
: 3d . . . etc.) opinion.

I used the one that George Dobbs, G3RJV brought over from the US.
Looking at the circuit, it seems a bit crude in the synth department,
also having the chief selectivity at audio is definitely not an optimum.
That said, I found the set worked much better than I anticipated. It
isn't perfect, but it is certainly a usable radio and the variable
selectivity is pleasant and effective to use.

I think it's not going to seem so good under crowded conditions and
in the presence of strong signals. The phase noise and gain/selectivity
profile are going to become apparant. If your intent is to cart one off
into the wilds, far from any madding crowds, then it should give you a
lot of fun.

This could become a "QRP standard" rig cult, rather like the old
argonaut. Several G-QRP members liked it and considered getting one on a
visit to the US. There is the usual big difference in UK and US prices,
and such a size of rig is easy to fit in luggage.

Cheers

hello all,

I have been given a 4 1/2 digit panel meter with a 199.99 mV range.
It is a Weston type 1234-276493.
I want to make a resistance divider for it so I can measure voltages
up to 20 V.
Yesterday I checked the meter with a precision voltage source and
found that the calibration ot the meter is way off.
(now I know why I got it for free :-))
The meter has 5 small potentiometers which are behind the plastic
front cover.
Question: does anyone know how to align this type of meter ?
What are the 5 potentiometers for ?

thank you,

PA3CKR, Charlos Potma

I think that modern rigs are so well protected that running into any
SWR is practically safe. Many people do it without harm being done.
For example, when driving PA, rigs put out full power against no load
before the PA switch kicks in. Perhaps running into high SWR for a
long time could be more harmful because reflected power dissipates in
the final amplifier increasing the chance of overheating. Still many
rigs have overheat protection.

Unfortunate part of transmitting into high SWR is power loss. At SWR
of 3:1 only about 50% power is transmitted, less if the protection
circuit reduces the output at high SWR.

How about this. I notice that the data port in the 733 has a line that
indicates squelch open/closed. Could one rig a simple device that would use
this signal to close the PTT circuit? Then feed the audio output from the
VHF from the one side to the audio input on the other side. When operating
VHF VHF, the result would be that anytime the squelch is opened on the one
side, the audio out is pased as audio in to the side set as active and viola,
an in band repeater. yes, no, am I an idiot? Humor me, this has become a
trivial pursuit. These may be stupid questions to you, but I just got the
radio and have not had much time to learn its features.

>handle it?

You may hurt your rig or not, depending how well it is designed.
Anyway, this does not matter, at least to the rest of the world.
What matters indeed, is that depending how the ALC or fold back
operates, you may end up putting out a considerable amount of splatter.

So you should better get your antenna fixed.

No it's not normal. I bought my radio in August of 1993. A fully charged
battery would last at least a week if I didn't transmit. Lately the
battery has been discharging in about 30 hours, whether I used the radio
or not. At first I thought the battery pack was going bad but the same
thing happened with another nicad pack as well as with the AA pack. I
measured the DC current from the battery and found it drew 40mA when
turned on and squelched, 35mA when turned off. The manual says that the
current draw when off should be 160 micro amps. The radio is going back to
Yaesu today. Too bad it isn't under warranty like yours is.

Best regards.

|> am just a happy customer)

I have used an Astron 35M for over 7 years, and have been very pleased with
it. I used to run a TS-440 from it, and now run a TS-850, as well as several
VHF/UHF multimode rigs. The only problem I ever had was when I strung up
a 80-meter dipole inside an apartment (a temporary situation). If I used
a tuner to operate on 40 meters and ran full power, RF got into the supply,
shutting down the supply. Cutting back to about 70 watts resulted in
no problems.

I can tell you what I know:

1. you can have amplifiers Class A, Class AB, Class B, Class C , Class D
ofcourse you have subclasses like AB-1 etc.

2. As you go from class A to class D amplifier efficiency increases.

3. AS you go from class A to class D more nad more input driving power is
required.

4. This classification is based on what portion of the RF cycle the
amplifier conducts as a direct consequence of amount of reverse
bias at input and hence varying degree of standby current.

5. Linear amplifiers (with a linear I/O relationship) is normally
of class AB-1 type.

6. You need linear Amps for SSB use. It is not required for FM use.

Hope this helps you to decide. 73 - de miki W2/VU2MKI

>
> Thanks

Thanks for the info. Below is what looks to apply to my config. The only problem I have is that my unit has two green wires comming off j13 - they are not mentioned in the mod, has anyone seen this before?

See below:

YAESU FT-530

Expanded Receive 110-180, 300-500 MHz
Expanded Transmit 130-180, 400-470 MHz

NOT LEGAL IN U.S.A - FOR EXPORT ONLY (The expanded transmit part)

o Keep that magnifying glass handy! 8-)
o Be aware that your repeater memories, ect. will be erased. :-(
o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on table.
o Note positioning of white paper insulator in right half of radio and lift out
(don't throw away)

o Carefully locate Jumper Pad 13 and remove solder.

---
o NOTE: If you wish to restrict transmit to the ham band,
Carefully locate Jumper Pad 15 and remove solder.
Otherwise, leave pad 15 in place.
---

o Re-install white paper insulator, make sure ground tab slides through the paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track to radio body.
o Attach Antenna and Battery.
o Turn off Radio.... Press and hold both arrow keys while turning on the Radio.
o Modification Complete.

```

Hi!

I'm new to the world of amateur radio and I need some advice. I take my exam early next year and I've therefore started looking at radios to buy. I may even buy before the exam to listen to, and understand more clearly operating procedures etc.

The question is what SORT of radio to go for. My main to uses will be voice and packet, and I had thought to opt for a dual band 2m/70cm radio. But mobile or hand portable?? I like the handportables because you don't need to worry immediately about external aerials and power supplies, and I travel a lot and so portability is a major factor. My only worry is their reduced power output. Any advice? Does a maximum of 5W make them realistically unuseable and just a 'toy', or is this enough to operate satisfactrily?

Any advice appreciated.

Regards,

Dan Cuff

P.S. I especially like the look of that new Kenwood TH79E......!

>you Form 660 arrives. There are no fees I am aware of.

I was just about to ask what the difference is between the Amateur operator license and the station license - but I know the difference between an operator and station license in the different radio service. Are your operator and station licenses separate pieces of paper ? - mine are one piece.

If you have a General license "in the frame" you're legit. The FCC form 660 is your station and operator license. It shows your operator privledges (general) and station privledges (primary - right?). How could you lose just the op license. If you operate away from your fixed operating location (e.g. mobile) just take that framed ticket out of the frame, photcopy it and stick the copy in your glove box. There is no requirement for you to have an original with you when you operate your station.

Why bother Gettysburg? OK - if you WANT a replacement for that little 660 you can put in your wallet you need to write to them.

Greetings,

Sometime between Friday evening, 11/4/94 and 11/7/94 morning, my truck was vandalized and a ham rig was stolen. Missing is: Icom IC-2410-H, s/n: 01082. This is a VHF/UHF FM transceiver.

The truck was at a service garage awaiting mechanical repairs when this happened.

A police report has been filed. Please watch the local hamfests and pawn shops for this rig.

There is a reward for the recovery of this rig.

I may be contacted in the Tulsa area via FrankO's BBS or BSOOM! BBS. On Internet (or FidoNet, CompuServe, AOL or other connecting gateways), can be reached at:

pferris%mohawk.uucp@drd.com *preferred reply path!*
pferris@tulsix.utulsa.edu
Telly: (918) 486-3880

Please feel free to air the above as a QST on your favorite net(s).

All info, help, etc; appreciated!

The BC-35 is a rapid charger. I believe it detects peak charge by the drop off in current draw at the end of the charge cycle. The "charge" LED will go off when the battery is fully charged if it is a fast charge battery. If the battery is only capable of slow charging, governed by the position of the two holes on the bottom of the battery pack, the LED will stay on and the unit will trickle charge forever.

Hi Guys, Let's look at the problem logically. If the reflected wave travelling back from the antenna "sees" a short circuit, open circuit, or a conjugate match then all of the reflected power will be re-reflected back toward the antenna and do no harm to the final amplifier. Since reflected power _can_ harm a final amplifier, it follows that none of the above three conditions are met in reality. At least some of the reflected power is absorbed and dissipated in the final amplifier. Too much reflected power can exceed the dissipation rating of the final amplifier causing damage and/or failure. Under certain forward/reflected voltage phasing conditions, the peak voltage rating of the final transistors might be exceeded. Built-in circuits detect unsafe conditions in most modern transceivers and "fold back" to a safe power dissipation level.

My ICOM-745 manual says, "Although this unit is built to handle VSWR up to 2:1, it is recommended that the antenna(s) be adjusted for the lowest possible VSWR... ALSO BE SURE THAT THE ANTENNA IMPEDANCE IS 50 OHMS OR THERE MAY NOT BE ANY OUTPUT. OTHERWISE THERE WILL BE DAMAGE TO THE TRANSCEIVER." No, I'm not screaming, this is an exact quote. :-)

Helge O Granberg used to work for MOtorola, where he designed a wide variety of good quality RF power amplifiers.

These amplifier designs are published as applications notes by Motorola, and appear, collected together in volume II of motorola's "RF DEVICE DATA" books.

You will need to build a set of lowpass filters to go after your power amp- you should find this in the handbook.

Communications concepts, that someone mentioned before, have a good reputation. Their amplifiers are kits for the Motorola designs. Get their catalogue and all will become clear. (If you go for their kilowatt FET job, I'll feel compelled to tell all the QRP clubs ;-))

Cheers

Aren't many linear transistor amplifiers running at only 50% efficiency.
If so, why not just throttle back the power input by 50 % Thus, even
if *all* the power were used to heat up the transistor, the heating of
the transistor would be no worse than with a 1:1 SWR at full power.

So, why don't manufacturers use better cooling and claim their radio
can operate at full power into any load?

Brad Herring (herring@nps.navy.mil) wrote:
: Hello All,
: I have a question concerning linear amps. I know that there are
: two different classes of amps. Class "C" and Class "AB-1". Can anbody
: explain the difference between the two and whcih would be a better
: amp for the money. This amp will also be used in a mobile. Help
: the confused!!!!!!

The class AB-1 amplifier is a linear amplifier. Provided you don't overdrive it, the output power will be a scaled replica of the input power. This is important for SSB and AM, in order to transmit undistorted audio and not "splatter" (IE transmit a broad spectrum of intermod products due to the different signal components in your SSB signal mixing with each other)
The class AB-1 amplifier efficiency will be in the 50% vicinity, so for a given output power, you'll need a lot of DC power from your supply, and will make a lot of heat. You can use this anplifier on other modes, like FM and FSK, but you may find that the designer undersized the heatsink by allowing for the lower mean power of an ssb signal.

The class C amplifier is really a NON-LINEAR amplifier. A very non-linear amplifier indeed. It is really a form of driving-into-saturation type of thing, to extract the last ounce of output power and efficiency from the device in use. Perhaps if you thought of the active device being driven into a "switched mode" it may help you envisage what is happening. This circuit will make strong harmonics, but you rely on the lowpass filters on the output to prevent them reaching the antenna. The class C amplifier can get into the late-60% efficiency league. It will give terrible intermod distortion between the components of a speech signal, and an effect rather like crossover-distortion in an audio amplifier. It is well suited to CW FM and FSK modes, where the advantage in power consumption, heat dissipation for a given power output are worth having.

Just out of historical interest, a lot of classic AM transmitters used to run class C output stages driven by a continuous unmodulated carrier. A large audio amplifier was used to modulate the HT supply to the class C amplifier anode, and the result was a particularly efficient AM transmitter. This is the only way to use a Class C amplifier in an AM transmitter. It is usually referred to as anode or high-level modulation. A more recent trick, not found in amateur equipment is to simultaneously high-level AM a class C stage, and phase modulate the carrier driving it, to be able to synthesise an SSB signal at the output. This is usually called a "polar-loop" SSB modulator/power amp. The added expense and difficulty gives an efficiency benefit that needs

a big transmitter for the power bill saving to pay for the hardware.

Does this help?
David GM4ZNX

Your choice depends on the modes you use, not on mobile/static.

<<Big Snip of instructions you already have>>

> >>>>>>> I can see J13 as shown above however there are two green wires
> comming off it and ideas?
>
It is only one wire, in a loop going from one pad to the other. This wire
replaced the solder bridge. Just snip a small piece of the green wire and
place heat shrink over the ends to keep them from touching anything.

Apparently Yaesu made this change because too many people were butchering
the radio's trying to remove the solder bridge. (Those pads are tiny.)

Just follow the disassembily instructions and do everything up till the
removal of the solder bridge for J13. Instead snip the Green wire and
install the heat shrink or perhaps a drop of glue over the ends (I prefer
heat shrink). Then reassemble according to the instructions. Don't
forget to hold down both the up/down arrow keys when powering up to rest
the processor.

I have made two such mods and both radios work fine.

Enjoy

Ken

I seem to recall that early runs had feedback from a coax rf-link somewhere (obviously between backplane board-sockets or to the P.A. chassis in back). The solution in later revs was a bypass cap and maybe additional cable ground attention. These revs and some mods were reported in an article ten or fifteen years ago in one of the main U.S. ham magazines. Somewhere I have this stored but no longer recall where. Some O.M. might have this info handy; the 210/215 is still a great mobile rig with these simple upgrades. 73's Jim K9ZAT.

You may be able to do this mod without taking the case completely
apart if you have the radio with the green wire. Just remove the
screws that hold the bottom plate in and see if you can reach and cut
the green wire - it's the only green wire around there. I realized
this on my radio after taking the case apart. If you can't see it by
simply removing the bottom plate, then go ahead and take the case
apart.

I used a small piece of electrical tape over the ends - didn't have
any heat shrink tubing small enough, and my usual method of shrinking
the tubing is to hold it over my electric stove with the element
glowing bright red. I didn't figure that would be good on the radio.

Considering the apparent similarity between the FT-5200 and the FT-5100, has anyone come up with a memory mod to increase the number of memory channels in the FT-5200 from 32 to the 94 that the FT-5100 has?

Thanks--

Doug Seyler WB5TKI

I have acquired a Heathkit SB401 SSB transmitter without a manual.

The unit tests good into a dummy load but I am not sure of the impedance of the microphone required. A 600 ohm mic. produces a lot of distortion on audio of a monitor receiver. Can a 600 ohm mic be "adapted" to work or is a higher impedance mic required?

Any replies to CSCHMUTTER@BCIT.BC.CA

Thanks

Colin Schmutter

>
> Jerry Kreifels
> KO6JV
> Jerry_A_Kreifels@ccm.hf.intel.com

Jerry,

This is "normal" I get it on my also. Yaesu says that the reason
is that the receivers are tweaked for the ham bands on each side
(vhf,uhf). This means that listening to 146.00 on uhf will sound worse.
It also means that listening to 130.00 mhz will be worse as well.

What I try to do, when scanning or etc, is to use the side (U/V) that
is in band (i.e 110-180 or so in vhf and 300-950 or so in uhf) (dont
quote me the freqs, your milage may vary, see dealer for details :-)

I gues this makes sense. If they needto put LC circuits the need
to be tuned to something! I would hope it would be the ham bands!

If you are familiar with the Kenwood ts430s, I'd like to hear from you.

I'm interested in knowing what year it was made, the frequencies it will receive/transmit on, any other notable features/deficiencies, and what a fair current price is for one.

I also noticed that the manual needs a change in the memory usage
area. It says that holding down the M>V button for 1/2 second
will load both of the VFO's from the front and rear memories.
This was true on the FT-890. I know for a fact as I had one. The
FT-900 doesn't do this. No big deal, just wrong in the book.

5876. Cut Wrong Jumper on TM-741A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-19 07:26:04 UTC
From: d827418@Oz.nthu.edu.tw
Message-ID: <3ak9ac$pp9@Emerald.Oz.nthu.edu.tw>
Source record: 222614

[Article crossposted from rec.ham-radio]
[Author was CharlesWang]
[Posted on 18 Nov 1994 10:51:37 GMT]

I cut the wrong jumper resistor on my TM-741A when doing
cross-band repeater mods. It is said that the mods requires
the removal of a BLUE 0-ohm jumper on the bottom side of the
control board, but the ONLY blue jumper in my TM-741A was on
the 430 MHz unit, and I just cut it.

```
[ ]
[ I <===== the BLUE jumper ]
[ that I cut. ] <=== 430 MHz unit.
[ ]
[ ]
[ ]
----------------------------------------
[ II <===== the correct one ]
[ to be cut. ] <=== control board
[ |--------| ]
[ | IC 2 | ]
[ |--------| ]
```

What is the effect when the blue chip resistor is cut?
If I want to recover it, how many ohms a resistor
should I put back? I have no manual in hand, so anyone
who knows the answer, please post here or E-mail to
CharlesWang@Oz.nthu.edu.tw
Thanks in advance. 73.

: I'm interested in knowing what year it was made, the frequencies it will
: receive/transmit on, any other notable features/deficiencies, and what a fair
: current price is for one.

I have one I purchased used from a store with a 30 day warranty about a
year ago for $750. (U.S.) it came with manual, mike, service manual
and power supply. I have seen them on swap nets for about $600 without
the power supply. One lucky person got one on r.r.swap for $350.

They were made for starting around 1984 (I think), mine was made in 1990.

They work resonably well as ham transcievers, but they are not as
sensative as I would like. Mine seems to be about 10db less sensitive
compared to a Drake TR7, Kenwood R5000 and NRD 535D.

The transceiver limits its input and output frequency range by
switching bandpass filters. At the low end of a range the reception is
poor. This is not a problem for me except for trying to copy rtty at
4.017 mHz. Note that 80/75m is at the high end of a range and is fine.

Without a cw filter I find cw copy impossible, except for 20m at night,
but that is my poorly tuned ear. I installed the 250hz, and except for
"ringing" normal with those filters it works very well, though I think
a better choice would be the 500Hz one.

I also found sw broadcast reception impossible without the (additional)
6kc filter. The only built in filter (ssb "wide" 2.4khz)is sharp enough
that it gives you an am bandwith of about 1.4khz which does nothing for me.

The stock unit transmits on 160,80,40,20,15,10 meters. It displays frequencies
in 100 Hz steps. You can open it up and cut a wire for two of the WARC bands,
and (a different wire) to display 10hz steps. There is an unoffical mod
to get full transmit capability. If you can't find it, I'll email it to you
if you send me your callsign.

It does not have a phone patch input, so you need to use the mike jack for
patches or packet.

I have been told that the stock mike sounds lousy, but that was compared
to a D-104 on another rig.

73, Geoff.

TLZ>> has ssen the same behavior. I run the 202 at home with an external 13.8 V
>> supply (with the battery back removed)

TLZ>Why would you remove the battery pack while in the house? What is the
>advantage of that?

This is wise, HTX-202-specific advice:

ALWAYS: Slide off your HTX-202 NiCad pack when using external DC power
from your vehicle or a power supply! Leaving the pack on while mobile
puts too much burden on the Zener diodes, and generates heat at twice
the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the HTX-202 will not top charge an Icom pack
while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN
ICOM BC-35 OR CLONE CHARGER.

Hello everyone,

I was wondering if anyone could point me in the direction of a cheap key that I could use with a keyer I was going to make (actually, the cmos super keyerII, which I had known about before all the postings- I've used it at my club-> very nice keyer! :)

I really like the Bencher keys. I don't even know the type I'm looking for :)

I think it's called an iambic keyer (had two paddles that you "squeeze" towards the center, contact is made, then you get a dot dot dot dot or dit dit dit dit).

Only problem is that these keys tend to be like $70. Is there a cheaper way to go? Or do you suggest splurging and just getting on?

E-mail is appreciated.

>handle it?

The basic design of the 735, and its protection circuits, are excellent.
It doesn't care what the load looks like. It can drive a short or an
open on the coax without harming itself. Of course it won't get out very
well that way. For full output, you need to get the VSWR down to 2:1 or
less.

Apparently. :-)

>Transistors dissipate power - everyone knows that. That's why, even
>in perfect conditions (1:1 SWR) your finals get warm. Heat is the
>enemy of transistors, above all else.

Not above all else. Voltage spikes are the enemy of solid state components above all else. A very brief spike can puncture a junction. Heat is second because it takes longer to cause a problem.

>So what's the big deal here? There's alwayts a voltage drop across the
>collector-emitter junction. There's a current flowing. P=V*I.
>So the transistor dissipates it as heat.

Yes. But to be a bit more precise P=V*I*cos(phi) where phi is the phase angle between current and voltage.

>Now take a poorly-matched load - some of the power that's supposed to
>be going out the antenna is reflected back into the finals, and the
>power's got to go somewhere (heat!!!).

There's only one direction of power flow in a transmitter, out the output port. For the reflected wave, the value of phi is 90 degrees by definition, and cos(90)=0. Any volt*ampere product multiplied by 0 is still 0. The voltages and currents do sum with the output voltages and currents in the transmitter output network to present a nasty impedance to the active device(s). That can lower the *efficiency* of the stage, and result in excess heat dissipated for a given output power. But that's subtly different from the reflected "power" being dissipated in the finals.

>Which is why a "foldback" scheme is used if hi-SWR shows up. Less power
>into the anteena means less power dissipated in the finals as heat.

Yes, but only because of the poor impedance match lowering stage efficiency.

>Yes, you can run a transistor into an open load or a dead short IF
>the power is limited (a short is dangerous, tho), but run a transistor
>at its full rated power into an open circuit and POOF.

POOF? A properly designed transmitter will protect itself from either an open or a short at it's output. Unfortunately, not all transmitters are

properly designed, but the IC735 is very good about tolerating all kinds of abusive loads. Its thermal control system is rather remarkable for a piece of amateur gear.

>can operate at full power into any load?

Good thermal design costs money and/or requires a degree of cleverness
from the thermal designer that's rare. The IC735 thermal system is
remarkable in a piece of amateur gear. Its about the best I've seen,
and it does it without being bulky or noisy.

Date: 1994-11-20 04:49:42 UTC
From: tcmayo@eng106.PSF.GE.COM
Message-ID: <3amkh6$3k4@eng106.PSF.GE.COM>
Source record: 222628

Hello all. I am trying to decide which 2m/70cm Dual Bander to buy.
Below is a table of the radios and which features they have. Please
comment if you see any errors and if you have any recommendations.

I NEED MORE INFO ON THE KENWOOD TH79A! I am using information for
the TH78A in the TH79A column.

Right now, I am leaning toward the ICOM. Any comments on this will
be helpful.

Feel free to copy this table, but keep the whole message intact!
Any errors are not my responsibility.

Thanks!

-Tom Mayo

5897. HP counter help needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-20 05:49:00 UTC
From: bob.albert@ledge.com
Message-ID: <89E051D.01B4000602.uuout@ledge.com>
Source record: 222616

In the earthquake last January my shack suffered lots of damage. I am finally getting it back together and discovered that one of the plugins for my HP counter isn't working properly.

I would like to find a manual for this unit. It's the heterodyne converter unit, covering 50 to 500 MHz for the 5245L (I think) counter. If anyone has access to drawings or other adjustment information, I'd appreciate some help.

The problem is mechanical. The knob turns hard, there is a lot of backlash, and it doesn't cover the entire range any more. I had it all apart today (well, mostly) and it's better; at least it works somewhat. But I'd like to refurbish it so it works as it should. The meter was messed up and I swapped with another plugin so that's taken care of, but that gives an idea of the heavy shock this unit sustained.

All help welcomed! I have an engineering degree, 45 years as a ham, and 13 years in the electronics repair business so I am confident I can get it working if I have the right documentation.

>well that way. For full output, you need to get the VSWR down to 2:1 or
>less.
>

I've been reading these comments about the excellent protection circuits
in the IC-735 and I was wondering if the protection is similar in the IC-736,
which I've just about decided to purchase.

I know the 736 has an automatic antenna tuner built in, which I don't
believe the IC-735 has, but I would hope the load protection is just as good
or better.

I think the automatic tuner in the IC-736 is an AT-170 and I wonder if
anyone is familiar with or has any comments on this or any other features
of the 736 . . . how it sounds or what if any problems it may exhibit.

I recently worked someone on the air who had just gotten a IC-736 and the
output sounded a little distorted, but I'm fairly sure (hopefully :-) that
it was being driven too hard, or was otherwise misadjusted.

Anyway, I'm pretty sold on it, but I would still be grateful for any and
all opinions and/or information.

Thanks much,
Alan

5899. Can BIRD Slugs be repaired?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-20 07:20:43 UTC
From: dgf@netcom.com
Message-ID: <dgfCzK1qJ.H85@netcom.com>
Source record: 222617

One of my BIRD wattmeter slugs mysteriously died on me. It was purchased new not too many years ago, and it suddenly is giving only a slight meter deflection, regardless of input power (other than 0 watts...)

Are these things throw-away when they die, or can BIRD repair them? The new one (I needed to get one locally right away) was $75, so I would sure like to get the existing one fixed if possible, because they aren't cheap.

Any advice appreciated...
73 Dave WB0GAZ dgf@netcom.com

Subject: Cut Wrong Jumper on TM-741A

• Article crossposted from rec.ham-radio !
• Author was CharlesWang !
• Posted on 18 Nov 1994 10:51:37 GMT !

I cut the wrong jumper resistor on my TM-741A when doing
cross-band repeater mods. It is said that the mods requires
the removal of a BLUE 0-ohm jumper on the bottom side of the
control board, but the ONLY blue jumper in my TM-741A was on
the 430 MHz unit, and I just cut it.

• !
• I <===== the BLUE jumper !
• that I cut. ! <=== 430 MHz unit.
• !
• !
• !

• II <===== the correct one !
• to be cut. ! <=== control board
• |--------| !
• | IC 2 | !
• |--------| !

What is the effect when the blue chip resistor is cut?
If I want to recover it, how many ohms a resistor
should I put back? I have no manual in hand, so anyone
who knows the answer, please post here or E-mail to
CharlesWang@Oz.nthu.edu.tw
Thanks in advance. 73.

I also noticed that the manual needs a change in the memory usage
area. It says that holding down the M>V button for 1/2 second
will load both of the VFO's from the front and rear memories.
This was true on the FT-890. I know for a fact as I had one. The
FT-900 doesn't do this. No big deal, just wrong in the book.

Hi Guys, Let's look at the problem logically. If the reflected wave
travelling back from the antenna "sees" a short circuit, open circuit, or
a conjugate match then all of the reflected power will be re-reflected back
toward the antenna and do no harm to the final amplifier. Since reflected
power _can_ harm a final amplifier, it follows that none of the above three
conditions are met in reality. At least some of the reflected power is

absorbed and dissipated in the final amplifier. Too much reflected power
can exceed the dissipation rating of the final amplifier causing damage
and/or failure. Under certain forward/reflected voltage phasing conditions,
the peak voltage rating of the final transistors might be exceeded. Built-in
circuits detect unsafe conditions in most modern transceivers and "fold back"
to a safe power dissipation level.

My ICOM-745 manual says, "Although this unit is built to handle VSWR up
to 2:1, it is recommended that the antenna(s) be adjusted for the lowest
possible VSWR... ALSO BE SURE THAT THE ANTENNA IMPEDANCE IS 50 OHMS OR
THERE MAY NOT BE ANY OUTPUT. OTHERWISE THERE WILL BE DAMAGE TO THE
TRANSCEIVER." No, I'm not screaming, this is an exact quote. :-)

stuff deleted

: Yes, you can run a transistor into an open load or a dead short IF
: the power is limited (a short is dangerous, tho), but run a transistor
: at its full rated power into an open circuit and POOF.

Aren't many linear transistor amplifiers running at only 50% efficiency.
If so, why not just throttle back the power input by 50 % Thus, even
if *all* the power were used to heat up the transistor, the heating of
the transistor would be no worse than with a 1:1 SWR at full power.

So, why don't manufacturers use better cooling and claim their radio
can operate at full power into any load?

I have recently have had over the last year some
very serious problems with
TREVOSE ELECTRONICS also working under HAMTRONICS
also advertizing in QST under KENWOOD REPAIRS
IF you have been ripped off by this company
please contact me so we can compare notes
and work as a group to prevent others from
having the same thing happen to them.
If you need KENWOOD REPAIRS I suggest you
use only a reputable organization with references
you can belive.
DO not accept references from people you do not know
For example Trevose were recomended to me BY AMETRON
who now tell me they will have nothing to do with them.
Trevose are a repair scam.
Parts and labour figures are exagerated beyond belive.
They take many months to do anything and are not
contactable after yousend a repair to them.
They will not return or cease work when instructed.
Basically I have heard from other people who
have been ripped off, the BUCKS COUNTY CONSUMER PROTECTION
can be called at 215 348 7442 to lodge a complaint.
However I am determined to make sure that as many people
as possible in the Amateur community become aware of the
danger of dealing with TREVOSE / HAMTRONICS / KENWOOD REPAIRS
allout of TREVOSE PA with 215 area code using different numbers.
Please contact me direct at roger@uptowne.com
or telephone anytime at 613 387 3080
fax 613 387 3081

>
>
>Can anyone tell me what the difference is between the two?
>
>--charlie WD5GNW

The 757GX had a rotary switch for mode select, and if width instead of notch. The 757gx cat was one direction, but the gxii was bi directional with mode select, and the front panel mode select
was by pressing a button. All else pretty much the same. I had both and preferred the gxii mode/cat
stuff but found shift and width better than shift and notch, so changed the notch filter to the one used by width in gxii to "downgrade" the if to gx. Much better.

If you are not using cat control the better rig for the money is the 757GX.
(In my opinion)

5910. Help with motorola MT 500

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-21 00:00:18 UTC
From: Steve Murdock <murdock@graceland.edu>
Message-ID: <3aonui$vda@insosf1.infonet.net>
Source record: 222633

I recently got a Motorola mT 500 HT with the fond hope of converting it to ham use in the 70cm band. It is set to transmit at 464.675 presently, and converting/programming(?) it to 440 band doesn't seem like a far jump. Does anyone know anything about how to do this or even if it's possible? There's some mysterious contacts on the side of the HT near the PTT switch. Any help would be welcome. Thanx in advance.

5911. Re: KENWOOD 733 IN-BAND

: How about this. I notice that the data port in the 733 has a line that
: indicates squelch open/closed. Could one rig a simple device that would use
: this signal to close the PTT circuit? Then feed the audio output from the
: VHF from the one side to the audio input on the other side. When operating
: VHF VHF, the result would be that anytime the squelch is opened on the one
: side, the audio out is pased as audio in to the side set as active and viola,
: an in band repeater. yes, no, am I an idiot? Humor me, this has become a
: trivial pursuit. These may be stupid questions to you, but I just got the
: radio and have not had much time to learn its features.

I am not going to call you an idiot but what you are thinking is a bit
idiotic. Try this some time and tell me the results. Put you radio into
VHF VHF mode and program in two different VHF frequencies, one continuous
brodcast such as weather radio or something. Program in an amateur
simplex freq on the VHF transmit and press the transmit key, identify and
watch what happens to the other frequency you were trying to listen to.
It should have been completely blocked out by the transmitter.

I have seen one radio that can do this though. A friend of mine owns a
motorola mobile that can do an in-band repeat. But it has two seperate
VHF receivers and a set of small duplexers built in.

Try that last test and you should see why an in-band repeat is almost
impossible to perform on a single unit without expensive duplexing units.

Source record: 222636

I've been eyeing the small QRP rigs MFJ is advertising. Have
spoken with a couple of people who seem happy with the CW versions, but
have yet to hear anything about the SSB "travel radio."
My main interest is in CW, but I like the idea of getting the
SSB version, adding the CW chip, and having a somewhat more agile rig
that I could use mainly for listening, but with the possibility of an
occasional contact.
Anyone had any experience with the MFJ? Would like to hear your
comments.

5913. Help! Power Supply Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-21 04:16:20 UTC
From: teixeira@ccnet.com
Message-ID: <3ap6uk$s0e@ccnet.ccnet.com>
Source record: 222512

Help!
I have a Yaesu FT101ZD with a built in power supply and a ICOM IC25A 2 meter rig on a Astron 12 Amp power supply. To make a long story short, each radio is now on a seperate power plug. Each radio on it's own works fine but the minute I transmit on the HF rig the power supply shuts down and seems to be quite warm. I shut it of and its ok until I transmit again. Since I only have a 40 meter ant. on the HF rig it has only happened on 40, it has not happened on the dummy load. Ihad the 2 meter ant on the mast for the Inverted V and I moved it, no change. I also had the two rigs on the same outlet, no change.

Subject: ALDA tribander transceiver

Simple question: In a vain attempt to keep from building
a three band hf rig for mobile use, I have approached a
coworker about buying his ALDA 103. It's a 3 band ssb/cw
rig from about 1980s, maybe. I can't remember when I last
saw an advert for one. It looks a lot like an ATLAS and
given the address on the partially complete manual that
exists for the radio, I think it came out of a building
right next door to ATLAS.
Anyway, it's got three band (80, 40, 20) and only 40 & 20
put out a signal. The RIT is a capacitor with a wire
routed to the VFO cktry. The RIT runs on receive and tx,
so that's another problem. Also serious dial backlash and
slip. Oh, and broadcast breakthrough on 40 meters in the
evening.

Any suggestions on how much this radio might be worth. I
want to get around to serious discussions before Christmas.

<<Big Snip of instructions you already have>>

> >>>>>>> I can see J13 as shown above however there are two green wires
> comming off it and ideas?
>
It is only one wire, in a loop going from one pad to the other. This wire
replaced the solder bridge. Just snip a small piece of the green wire and
place heat shrink over the ends to keep them from touching anything.

Apparently Yaesu made this change because too many people were butchering
the radio's trying to remove the solder bridge. (Those pads are tiny.)

Just follow the disassembily instructions and do everything up till the
removal of the solder bridge for J13. Instead snip the Green wire and
install the heat shrink or perhaps a drop of glue over the ends (I prefer
heat shrink). Then reassemble according to the instructions. Don't
forget to hold down both the up/down arrow keys when powering up to rest
the processor.

I have made two such mods and both radios work fine.

Enjoy

Ken

Subject: HELP!!! What do I choose? I need a dual band mobile!

Hi there,

I am considering purchasing a dual band mobile radio. I was hoping
that someone out there could help me decide which dual band mobile to choose.

Here are the options I see so far...

Kenwood TM733a
Icom IC2340H/IC2700H
Alinco DR600
Yaesu FT5100/FT5200

I would like to know the pro/con's of what you feel on each radio. So far I
would pick either the TM733a OR Yaesu FT5100/FT5200. Kenwood because their
face comes straight off without diconnecting any wires, and Yaesu because of
the backlit keypad.

Please help me out...
Thanks,
Justin Bousquet

t connected to power, or
>the radio may switch with a reed relay which is very quiet. Not familiar with
the D33CMT specifically.

Georgec - please watch your line length - many of us are using 80 column
terminals.

You are correct about the power wiring, but you are describing a trunk
mount radio. The "D" in "D33..." indicates a dash mount. I'd look for
a Molex-style connector on the left or right side of the radio,
somewhere near the front. I haven't been inside a 'CMT in 10
years. I can tell you that the 1170 means:

1=Carrier Squelch (3 in this position=PL)
1=Narrowband (+/- 5khz dev, 0=+/- 15khz dev)
70=multichannel - I forget the exact details except it's an unbalanced
combination. 00=1freq t&r, 10=2ft, 1fr, 30=2f, 90=4f.
It's a vague memory, but 70 _might_ be 4ft, 2fr.

I seem to remember that the Metrum mobile shared the same power plug.
If so, it's 6-pin molex.

: explain the difference between the two and whcih would be a better
: amp for the money. This amp will also be used in a mobile. Help
: the confused!!!!!!

The class AB-1 amplifier is a linear amplifier. Provided you don't
overdrive it, the output power will be a scaled replica of the input

power. This is important for SSB and AM, in order to transmit undistorted audio and not "splatter" (IE transmit a broad spectrum of intermod products due to the different signal components in your SSB signal mixing with each other)
The class AB-1 amplifier efficiency will be in the 50% vicinity, so for a given output power, you'll need a lot of DC power from your supply, and will make a lot of heat. You can use this anplifier on other modes, like FM and FSK, but you may find that the designer undersized the heatsink by allowing for the lower mean power of an ssb signal.

The class C amplifier is really a NON-LINEAR amplifier. A very non-linear amplifier indeed. It is really a form of driving-into-saturation type of thing, to extract the last ounce of output power and efficiency from the device in use. Perhaps if you thought of the active device being driven into a "switched mode" it may help you envisage what is happening. This circuit will make strong harmonics, but you rely on the lowpass filters on the output to prevent them reaching the antenna. The class C amplifier can get into the late-60% efficiency league. It will give terrible intermod distortion between the components of a speech signal, and an effect rather like crossover-distortion in an audio amplifier. It is well suited to CW FM and FSK modes, where the advantage in power consumption, heat dissipation for a given power output are worth having.

Just out of historical interest, a lot of classic AM transmitters used to run class C output stages driven by a continuous unmodulated carrier. A large audio amplifier was used to modulate the HT supply to the class C amplifier anode, and the result was a particularly efficient AM transmitter. This is the only way to use a Class C amplifier in an AM transmitter. It is usually referred to as anode or high-level modulation. A more recent trick, not found in amateur equipment is to simultaneously high-level AM a class C stage, and phase modulate the carrier driving it, to be able to synthesise an SSB signal at the output. This is usually called a "polar-loop" SSB modulator/power amp. The added expense and difficulty gives an efficiency benefit that needs a big transmitter for the power bill saving to pay for the hardware.

Does this help?
David GM4ZNX

Your choice depends on the modes you use, not on mobile/static.

I also noticed that the manual needs a change in the memory usage
area. It says that holding down the M>V button for 1/2 second
will load both of the VFO's from the front and rear memories.
This was true on the FT-890. I know for a fact as I had one. The
FT-900 doesn't do this. No big deal, just wrong in the book.

Hi Guys, Let's look at the problem logically. If the reflected wave
travelling back from the antenna "sees" a short circuit, open circuit, or
a conjugate match then all of the reflected power will be re-reflected back
toward the antenna and do no harm to the final amplifier. Since reflected
power _can_ harm a final amplifier, it follows that none of the above three
conditions are met in reality. At least some of the reflected power is
absorbed and dissipated in the final amplifier. Too much reflected power
can exceed the dissipation rating of the final amplifier causing damage
and/or failure. Under certain forward/reflected voltage phasing conditions,
the peak voltage rating of the final transistors might be exceeded. Built-in
circuits detect unsafe conditions in most modern transceivers and "fold back"
to a safe power dissipation level.

My ICOM-745 manual says, "Although this unit is built to handle VSWR up
to 2:1, it is recommended that the antenna(s) be adjusted for the lowest
possible VSWR... ALSO BE SURE THAT THE ANTENNA IMPEDANCE IS 50 OHMS OR
THERE MAY NOT BE ANY OUTPUT. OTHERWISE THERE WILL BE DAMAGE TO THE

TRANSCEIVER." No, I'm not screaming, this is an exact quote. :-)

stuff deleted

: Yes, you can run a transistor into an open load or a dead short IF
: the power is limited (a short is dangerous, tho), but run a transistor
: at its full rated power into an open circuit and POOF.

Aren't many linear transistor amplifiers running at only 50% efficiency.
If so, why not just throttle back the power input by 50 % Thus, even
if *all* the power were used to heat up the transistor, the heating of
the transistor would be no worse than with a 1:1 SWR at full power.

So, why don't manufacturers use better cooling and claim their radio
can operate at full power into any load?

: I'm interested in knowing what year it was made, the frequencies it will
: receive/transmit on, any other notable features/deficiencies, and what a fai
r
: current price is for one.

I have one I purchased used from a store with a 30 day warranty about a
year ago for $750. (U.S.) it came with manual, mike, service manual
and power supply. I have seen them on swap nets for about $600 without
the power supply. One lucky person got one on r.r.swap for $350.

They were made for starting around 1984 (I think), mine was made in 1990.

They work resonably well as ham transcievers, but they are not as
sensative as I would like. Mine seems to be about 10db less sensitive
compared to a Drake TR7, Kenwood R5000 and NRD 535D.

The transceiver limits its input and output frequency range by
switching bandpass filters. At the low end of a range the reception is
poor. This is not a problem for me except for trying to copy rtty at
4.017 mHz. Note that 80/75m is at the high end of a range and is fine.

Without a cw filter I find cw copy impossible, except for 20m at night,
but that is my poorly tuned ear. I installed the 250hz, and except for
"ringing" normal with those filters it works very well, though I think
a better choice would be the 500Hz one.

I also found sw broadcast reception impossible without the (additional)
6kc filter. The only built in filter (ssb "wide" 2.4khz)is sharp enough
that it gives you an am bandwith of about 1.4khz which does nothing for me.

The stock unit transmits on 160,80,40,20,15,10 meters. It displays frequencies
in 100 Hz steps. You can open it up and cut a wire for two of the WARC bands,
and (a different wire) to display 10hz steps. There is an unoffical mod
to get full transmit capability. If you can't find it, I'll email it to you
if you send me your callsign.

It does not have a phone patch input, so you need to use the mike jack for
patches or packet.

I have been told that the stock mike sounds lousy, but that was compared
to a D-104 on another rig.

73, Geoff.

Subject: Wanted, Clegg FM-76 Manual

After a 25 year absence from 220 band, I finally took the plunge and
bought a Clegg FM-76 Crystal controlled transciever last night.

I need the manual. At the very least the schematics for this thing.
I got it working this morning, but I would like to have it on hand
if something should go wrong with it.

13.8VDC mobile radio, 222-225MHz 12 channel crystal controlled transceiver.

Thanks, 73 es GM from Jeff.

Subject: YAESU FT-757 GX vs. FT-757 GX II ?

In article <3am48q$s3k@usenet.INS.CWRU.Edu>, cs684@cleveland.Freenet.Edu (Char
les G. Lafkoff) says:
>
>
>Can anyone tell me what the difference is between the two?
>
>--charlie WD5GNW

The 757GX had a rotary switch for mode select, and if width instead of notch.
The 757gx
cat was one direction, but the gxii was bi directional with mode select, and t
he front panel mode select
was by pressing a button. All else pretty much the same. I had both and prefer
red the gxii mode/cat
stuff but found shift and width better than shift and notch, so changed the no
tch filter
to the one used by width in gxii to "downgrade" the if to gx. Much better.

If you are not using cat control the better rig for the money is the 757GX.
(In my opinion)

I've been saving money toward a dual-band HT and had been leaning toward the Icom W21-AT until I saw an add for the Kenwood. One feature I didn't see was 800+ MHz receive coverage from Kenwood. Does it? Can it? I didn't see this mod in the file at OAK.

The 800+ coverage is for monitoring pit to car communications at INDY. (I have no interest in the cellular stuff...it's boring. Make that, "It WAS boring...").

Thanks, in advance,
-= Brad =-

5916. Wanted: really tough HT

Newsgroup: rec.radio.amateur.equipment

Source record: 222645

Anyone have any opinons on the Azden AZ-21 2-meter HT??

I want a tough-as-nails HT that has keyboard frequency and
PL-tone entry. I assume the "direct frequency entry" part
eliminates all commercial rigs, right?

The Radio Shack HTX-202 fits the bill RF-wise but looks
far too "plasticy". I do know about their warranty, but
would rather have a tough unit to begin with than rely
on replacement and a warranty as the back-up option.

Anything else I should look at?? I'm sick of the poor mechanical
quality of all the Kenwood/Alinco/Yaesu stuff. Why do gizmos,
bells and whistles appear to be the driving force behind HT
design? I know, I know...that's what most people want.

Mike Stramba (mike@io.org) wrote:
: Is anyone familiar with the Atlas 210x HF xcvr?

It was state of the art in its day, which was about the mid 1970's.
I got one a year and a half ago and used it while operating as YN1ASW
in Nicaragua last year.

: I'm going to look at it tomorrow night. The seller is asking $500.

I think that price is about 2X too high.

: It is a solid state unit that will run on 12v, has 250w of transmit power,
: and covers 10 - 160 meters.

You'll be lucky to get 100 watts out at 13.6 volts, and it will be
less at 12 volts. The 210x covers 80 - 10. There was a very similar
model, the 215x, that covered 160 - 15.

I liked that rig, it is still waiting for me in Central America, but
it was not trouble free. I had nasty problems with spurious
oscillations in the final on certain bands as the power level was
increased. This seemed to depend upon the match to the antenna. I
ended up being very cautious about operating when my housemates wanted
to watch television.

> KO6JV
> Jerry_A_Kreifels@ccm.hf.intel.com

Jerry,

This is "normal" I get it on my also. Yaesu says that the reason
is that the receivers are tweaked for the ham bands on each side
(vhf,uhf). This means that listening to 146.00 on uhf will sound worse.
It also means that listening to 130.00 mhz will be worse as well.

What I try to do, when scanning or etc, is to use the side (U/V) that
is in band (i.e 110-180 or so in vhf and 300-950 or so in uhf) (dont
quote me the freqs, your milage may vary, see dealer for details :-)

I gues this makes sense. If they needto put LC circuits the need
to be tuned to something! I would hope it would be the ham bands!

My favorite 2m rig... 10w on Hi, 15kHz spacing, 146-148 MHz, 22 switchable synthesized channels, diode programmable. Good sensitivity without intermod.

With a kit from TechnoLogic Concepts, it covers 144.62-148 MHz, 5kHz spacing, over 650 thumbwheel selectable frequencies/channels.

If it already has the TechnoLogic Concepts kit, it is worth $125. Otherwise, it is worth about $50-$75.

I've been eyeing the small QRP rigs MFJ is advertising. Have spoken with a couple of people who seem happy with the CW versions, but have yet to hear anything about the SSB "travel radio."
My main interest is in CW, but I like the idea of getting the SSB version, adding the CW chip, and having a somewhat more agile rig that I could use mainly for listening, but with the possibility of an occasional contact.
Anyone had any experience with the MFJ? Would like to hear your comments.

I purchased the HT-79 when I was in Washington recently (Thank you, those of you who pointed me to a good place for ham equipment in DC). I now need to do the diode-mod described elsewhere to be able to use the Norwegian 70cm band (10MHz below the US). While I'm at it - does anyone know what the rest of the diodes will do? It would be nice to be able to transmit 1750 hz without whistling into the mic.
I always ewas an Icom person, now I don't know..;-)

<snip>
: I am not going to call you an idiot but what you are thinking is a bit
: idiotic. Try this some time and tell me the results. Put you radio into
: VHF VHF mode and program in two different VHF frequencies, one continuous
: brodcast such as weather radio or something. Program in an amateur
: simplex freq on the VHF transmit and press the transmit key, identify and
: watch what happens to the other frequency you were trying to listen to.
: It should have been completely blocked out by the transmitter.

I think the point is that the TM-733 locks out this operation, so
this test cannot be performed. That is, the radio disables the
VHF receiver when you transmit on a VHF freq.

: I have seen one radio that can do this though. A friend of mine owns a
: motorola mobile that can do an in-band repeat. But it has two seperate
: VHF receivers and a set of small duplexers built in.

: Try that last test and you should see why an in-band repeat is almost
: impossible to perform on a single unit without expensive duplexing units.

Hmmm. I think we have a couple of things getting mixed together here.
There are numerous commercial radios (Motorola Micor, Mitrek, GE
Master II, ...) that can do in-band full duplex. That's why so many
hams use them for repeaters. There is only ONE receiver in these
units but there is sufficient isolation between transmit and receive
to keep the transmitter from desensing the receiver. The issue of
whether a duplexor is required is external to the issue of the
inherent isolation inside the radio.

Now, returning to the Tm-733 discussion. My guess is that the 733 does
not have sufficient isolation to keep its transmitter out of the
receiver. On the other hand, if you had some small amount of desense,
it might still be useful in some applications. One might try to use
the CTCSS capability to help keep the radio from locking up. Your
mileage may vary. (Note that the difference between the transmit
and receive frequencies will probably be an issue...bigger difference,
more likely to be less desense. Since the UHF band is wider than
VHF, I've often wondered if a TM-733 style radio might be able to
handle cross-banding from the extreme edges of the UHF band...keeping
in mind the bandplan.)

If you try the PTT/Squelch connection, I'd be interested in the results.

73,

Bob

I am looking for others who have a Hammarlund HQ-215. I have one working set
and a parts set.

I am interested in learning more about the history of the HQ-215, particularly
what were the design problems with led to a Mark II version being produced (it
was advertised though I have never actually seen or heard of one).

Does anyone out there have a Mark II? A book for the Mark II?

I have already talked with Robert Fowle and he has little to offer as far a
documentation is concerned.

Moving that radio to the 440 ham band is quite possible. The big deal will be buying crystals...those little plug-in lumps are not just crystals, but also include the oscillator and some compensation as well. Unless you're extremely patient and good at miniaturized circuit work, I'd recommend sending them (they're called channel elements) to International Crystal to be recrystaled and temperature compensated. The only gotcha is the cost: it'll run you about $70 per channel (one receive, one transmit channel element). Outside of that, it's just a matter of tuning it up.

Your radio is the universal model. Those contacts on the side are connections for a speaker-mic or convertacom mobile adapter; the two spring-loaded contacts are receive audio (pressing it in disconnects the internal speaker) and antenna (pressing it in disconnects the internal antenna). Those contacts need to be kept clean inside the radio, and they're a bit hard to get to.

If your radio still has the sticker on the back with the model number, you can tell what its power rating is; if the model number is H24BBUnnnn, then it's a 1-watt radio, while H34BBUnnnn is 5 watts. The PA module on the 5 watt radio extends into the back frame (it's the one screwed to the metal frame right above the PTT).

Good luck. I have one on the 440 band, and it works fine. It's almost completely immune to intermod, thanks to the helical front end, and has all the receive audio you'd ever want. Mine is also _yellow_, but that's another story...

I am looking for a list of mods for the Heathkit SB200. I have checked oakland.edu and nothing exists. Basically I want to know what type of mods exist, not necessarily the directions for the mod itself. I am considering purchasing one and would like to know how it can be 'improved'.

Some of my questions are:

Can it be made to do 10-160m instead of 10-80?

What about WARC bands ?

How much are a set of replacement tubes? or what are they for that matter ?

tnx
KR4UJ Paul

5926. HTX202: reason for removing battery pack

P>Is there a site where I can get the up-to-date collection of equipment
>mods? The mods I have go up to about 1990, and I am looking at getting
>some new equipment.

Not a site, but the QRZ! Ham Radio CD-ROM (latest issue, Summer 1994)
has hundreds of Mod files. . .plus THOUSANDS of other Ham-oriented texts
and programs.

It also has a Ham Radio Callbook (with MS-DOS and Windows search
engines), FCC regulations, DX lists, and Simtel Ham Radio programs.

All this for less than thirty bucks retail.

The new issue will be coming out in January/February 1995. But you
cannot go wrong obtaining the current release.

(By the way, my TNC program, KAGold by Interflex, automatically
interfaces with this CD, too --- when I connect with a Packet BBS, I am
instantly provided with the Name, Location, et al from the CD's Callsign
Database!)

There is a company, Sinclair Labs I think, that sells 2m bandpass filters that consist of four cavities in a box about the size of a 2m amp. It claims 100dB of suppression of out-of-band signals and a 1 or 2dB (I think) insertion loss.

They have an ad in the latest issue of CQ.

5935. Help - IC-229H Intermittent Transmit

Newsgroup: rec.radio.amateur.equipment

This is very unlikely. At least on 2M : the tx/rx distance is 600 kHz.
Doing fullduplex (talking to the repeater input AND listening to the repeater
output at the SAME time, that is) on ONE antenne requires at least 6 very
large (1/4 wavelength) cavity's. 3 on the tx side to suppress spourious
on the rx qrg, and 3 on the rx side to suppress the tx qrg.

You need at least 100dB isolation between the tx output and the rx input,
on both frequency's.

> Now, returning to the Tm-733 discussion. My guess is that the 733 does
> not have sufficient isolation to keep its transmitter out of the

i am very sure that is has not enough isolation : Make some calculations :

5W=+33dBm. The receiver operates at -120 dBm. This is a difference of more than 150 dB, or a factor of 1000.000.000.000.000 !

This can only be done with a large tx/rx frequency distance, say 10 MHz at 440, *and* extensive filtering in tuned helical cavity's for mobile use.

Of course you don't need 150 dB isolation between tx and rx, about 100 dB is enough in most cases : when you take some desensing for granted.
But 100 dB is still a lot !

> receiver. On the other hand, if you had some small amount of desense,
> it might still be useful in some applications. One might try to use

> VHF, I've often wondered if a TM-733 style radio might be able to
> handle cross-banding from the extreme edges of the UHF band...keeping
> in mind the bandplan.)

yes, IF the TM733 had different antenne connections for both receivers !
Then you could use duplexer cavity's. But with only one antenna plug, this is impossible.

(b.t.w.: the 733 probably does not have 2 receivers, only 2 MF strips...)

> If you try the PTT/Squelch connection, I'd be interested in the results.

Hi David. Well add the Yaesu FT-530 to your list of radios that will do this. After reading this thread I thought I'd try it out. The sensitivity is greatly reduced, true, but it can be done. I didn't do a distance test to see how far away I could get from the radio and still overcome desensing of the receiver, but I can say it worked in all parts of my house. ;-) In fact, I didn't even use THAT big of a split. I used about a 1.2 MHz split. My father in law, who lives about 5 blocks away from me participated in this test. He told me I sounded fine.

From: bobw@col.hp.com (Bob Witte)
Subject: KENWOOD 733 IN-BAND

<snip>
: I am not going to call you an idiot but what you are thinking is a bit
: idiotic. Try this some time and tell me the results. Put you radio into
: VHF VHF mode and program in two different VHF frequencies, one continuous
: brodcast such as weather radio or something. Program in an amateur
: simplex freq on the VHF transmit and press the transmit key, identify and
: watch what happens to the other frequency you were trying to listen to.
: It should have been completely blocked out by the transmitter.

I think the point is that the TM-733 locks out this operation, so
this test cannot be performed. That is, the radio disables the
VHF receiver when you transmit on a VHF freq.

: I have seen one radio that can do this though. A friend of mine owns a
: motorola mobile that can do an in-band repeat. But it has two seperate

: VHF receivers and a set of small duplexers built in.

: Try that last test and you should see why an in-band repeat is almost
: impossible to perform on a single unit without expensive duplexing units.

Hmmm. I think we have a couple of things getting mixed together here. There are numerous commercial radios (Motorola Micor, Mitrek, GE Master II, ...) that can do in-band full duplex. That's why so many hams use them for repeaters. There is only ONE receiver in these units but there is sufficient isolation between transmit and receive to keep the transmitter from desensing the receiver. The issue of whether a duplexor is required is external to the issue of the inherent isolation inside the radio.

Now, returning to the Tm-733 discussion. My guess is that the 733 does not have sufficient isolation to keep its transmitter out of the receiver. On the other hand, if you had some small amount of desense, it might still be useful in some applications. One might try to use the CTCSS capability to help keep the radio from locking up. Your mileage may vary. (Note that the difference between the transmit and receive frequencies will probably be an issue...bigger difference, more likely to be less desense. Since the UHF band is wider than VHF, I've often wondered if a TM-733 style radio might be able to handle cross-banding from the extreme edges of the UHF band...keeping in mind the bandplan.)

If you try the PTT/Squelch connection, I'd be interested in the results.

73,

Bob

Subject: Low Power Receiver for Solar Repeater

Dear NetHams:

I'm looking for a low power quality VHF receiver to use in a solar powered repeater. Before I purchase/barter/trade for one, does the networld have advice on a model or particular type of RECEIVER I should be looking for?

Specifications (in order of importance):

* Operates without modification at 147 to 148 MHz (proper split).
* Must be stable from -40 to +50 C and meet commercial type approval specs within this temperature range.
* TCXO
* standby current consumption of 50 mA or less
* Sensitivity for 12 dB SINAD of -117 dBm (0.3 microvolts)

* Usual commercial selectivity of 60 dB@30 kHz or better (amateur products need not apply)
* Easy audio and COS interface
* Some form of hysterisis squelch (noise gate, like Micors/or variable gain stage, like Daniels). This would be nice!
* Preselection and/or good mixer TOI characteristics (duplexer takes care of this to an extent).

The receiver will be used at an existing (VA3PLA) Solar powered amateur repeater 150 miles northeast of the Toronto area. The site is on top of a hill, and the temperature/weather can range from hot (100 F) in the summer to cold (-40 F/C) in the winter. Most of the time, the repeater is in standby, so it is desirable to minimize this constant current consumption. Other specs noted above are consistent with a repeater application.

Someone suggested that a Motorola MX300 receiver would be suitable. A Daniels receiver would certainly be good, but since we havn't won a lottery, it can't be afforded. This is a shoe-string budget affair. Any suggestions or recommendations for a suitable receiver would be appreciated.

Regards,

Tony Komljanec, VE3PEP

Subject: Atlas 210x HF xcvr

Mike Stramba (mike@io.org) wrote:
: Is anyone familiar with the Atlas 210x HF xcvr?

It was state of the art in its day, which was about the mid 1970's.
I got one a year and a half ago and used it while operating as YN1ASW
in Nicaragua last year.

: I'm going to look at it tomorrow night. The seller is asking $500.

I think that price is about 2X too high.

: It is a solid state unit that will run on 12v, has 250w of transmit power,
: and covers 10 - 160 meters.

You'll be lucky to get 100 watts out at 13.6 volts, and it will be
less at 12 volts. The 210x covers 80 - 10. There was a very similar
model, the 215x, that covered 160 - 15.

I liked that rig, it is still waiting for me in Central America, but
it was not trouble free. I had nasty problems with spurious
oscillations in the final on certain bands as the power level was
increased. This seemed to depend upon the match to the antenna. I
ended up being very cautious about operating when my housemates wanted
to watch television.

Jerry,

This is "normal" I get it on my also. Yaesu says that the reason
is that the receivers are tweaked for the ham bands on each side
(vhf,uhf). This means that listening to 146.00 on uhf will sound worse.
It also means that listening to 130.00 mhz will be worse as well.

What I try to do, when scanning or etc, is to use the side (U/V) that
is in band (i.e 110-180 or so in vhf and 300-950 or so in uhf) (dont
quote me the freqs, your milage may vary, see dealer for details :-)

I gues this makes sense. If they needto put LC circuits the need
to be tuned to something! I would hope it would be the ham bands!

Subject: FT-530 cross band reception poor--normal?

I have a Yaesu FT-530 a couple months old, and have seen something peculiar when listening to a VHF station on the UHF side of the radio. The signal quality and strength are considerable less on the UHF side (by about 3 S units) when I dial the same frequency on both sides. Is this normal? I like to use this to listen in on a conversation while scanning other frequencies.

Also, the manual cautions not to have the opposite channel tuned to your transmit frequency when transmitting. Does any one know what is a safe spacing here? i

Would appreciate any suggestions.

My favorite 2m rig... 10w on Hi, 15kHz spacing, 146-148 MHz, 22 switchable
synthesized channels, diode programmable. Good sensitivity without intermod.

With a kit from TechnoLogic Concepts, it covers 144.62-148 MHz, 5kHz spacing,
over 650 thumbwheel selectable frequencies/channels.

If it already has the TechnoLogic Concepts kit, it is worth $125. Otherwise,
it is worth about $50-$75.

Subject: MFJ QRP rigs

I've been eyeing the small QRP rigs MFJ is advertising. Have
spoken with a couple of people who seem happy with the CW versions, but
have yet to hear anything about the SSB "travel radio."
My main interest is in CW, but I like the idea of getting the
SSB version, adding the CW chip, and having a somewhat more agile rig
that I could use mainly for listening, but with the possibility of an
occasional contact.
Anyone had any experience with the MFJ? Would like to hear your
comments.

>some new equipment.

Not a site, but the QRZ! Ham Radio CD-ROM (latest issue, Summer 1994)
has hundreds of Mod files. . .plus THOUSANDS of other Ham-oriented texts
and programs.

It also has a Ham Radio Callbook (with MS-DOS and Windows search
engines), FCC regulations, DX lists, and Simtel Ham Radio programs.

All this for less than thirty bucks retail.

The new issue will be coming out in January/February 1995. But you
cannot go wrong obtaining the current release.

(By the way, my TNC program, KAGold by Interflex, automatically
interfaces with this CD, too --- when I connect with a Packet BBS, I am
instantly provided with the Name, Location, et al from the CD's Callsign
Database!)

5947. TS-140S vs TS-50S vs FT840 vs IC725

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-22 04:36:40 UTC
From: sami@bnr.ca
Message-ID: <3arsgo$e9t@bcarh8ab.bnr.ca>
Source record: 222576

I'd be interested in your experience and opinions on the
Kenwood TS-140S, Kenwood TS-50S, Yaesu FT-840 and Icom IC-725. The
two vying for my choice are the TS-140S and FT-840. Areas
of interest are:

-How would these rank as receivers, in terms of selectivty, dynamic
range, sensitivity, etc. ? I do a lot of shortwave listening,
mainly on AM, but sometimes on SSB, so the quality of the receiver
is important. How would the receiver on these rigs compare with, say
a Kenwood R5000? Do I really need to get extra filters for my kind of
listening?

-How do these compare as transmitters?

-Does any rig have any serious deficiencies or lack of an important
feature (e.g. lack of a VOX, if that's considered a deficiency)? Or,
are all these more or less the same?

-How easy is it to operate these rigs? How good is the supplied
documentation?

-How reliable are these rigs? Does any have well-known quality
control problems? How good is the service from Kenwood (in
Canada or the US), Yaesu , and Icom (in Canad or the US) ?

-For the Canadian readers, what are your experiences with the
ham shops in Ontario and Quebec? I am especially interested
in your experiences with Elkel, Norham, Atlantic Ham Radio,
Radio Progressif, and Macfarlane.

-What is the recommended power supply for each (20A, 13.5 v?)? I
believe an Astron RS-20 supply would work with all.

Any further information would be appreciated.

>purchasing one and would like to know how it can be 'improved'.

>Some of my questions are:

>Can it be made to do 10-160m instead of 10-80?

Yeah, the mod isn't so bad, but unless you want to change out the band switches, you have to give up another band. I just changed the 80m input and output tuning sections by adding the appropriate capacitances. Had to increase the circuit inductances too to avoid changing the circuit Q too much. But with good components it's not too hard. No, it's not from an article, just figured it out myself.

>What about WARC bands ?

I always had success tuning the amp for the next higher band: 17m used 15m switch position and 12m used 10m switch position. Adjust the tune and load for resonance. Again, you're changing the circuit Q, so the tuning "feel" is a bit different, but those two bands are so narrow (especially in terms of the actually used bandwidth) that I never felt hemmed in.

>How much are a set of replacement tubes? or what are they for that matter ?

The tubes are NOTORIOUSLY a pain! They are T-160-L or 572B; essentially a beefed up 811A with extra graphite on the plate. I personally do not like them at all. You can buy cheap Chinese knock-offs for about $100 a pair; the good USA ones are nearly double that, and they seem to be getting rarer each passing day. I've seriously considered retubing my SB-200 for 4CX300A tubes; there is an article which shows mods for retubing using 8873 (I think-it's the conduction cooled tube Eimac makes).

: > inherent isolation inside the radio.

: This is very unlikely. At least on 2M : the tx/rx distance is 600 kHz.
: Doing fullduplex (talking to the repeater input AND listening to the repeater
: output at the SAME time, that is) on ONE antenne requires at least 6 very
: large (1/4 wavelength) cavity's. 3 on the tx side to suppress spourious
: on the rx qrg, and 3 on the rx side to suppress the tx qrg.

Right. Read again to see that I said that the duplexor issue is separate
from whether the radio inherently has the internal isolation.

: > receiver. On the other hand, if you had some small amount of desense,
: > it might still be useful in some applications. One might try to use
: > the CTCSS capability to help keep the radio from locking up. Your

: > VHF, I've often wondered if a TM-733 style radio might be able to
: > handle cross-banding from the extreme edges of the UHF band...keeping
: > in mind the bandplan.)

: yes, IF the TM733 had different antenne connections for both receivers !
: Then you could use duplexer cavity's. But with only one antenna plug, this
: is impossible.

Good point. When amateurs convert commercial (mobile) gear to repeater
use, they separate out the transmit and receive antenna ports.

Ne> prevent the Cross Band Repeater from being able to transmit. Is that
Ne> true? If so, any way around it?

Ne> Thanks

Ne> Andy
Ne> KB8PZC

That's exactly right, Andy. The repeater carrier stays on the air,
so your crossband radio keeps sending it too you... and never stops to
listen for you to transmit.

There's one simple way to work around it... IF you can hear the main
repeater with your HT. Set up your crossbander for one-way repeating
(repeating you to the main repeater, but NOT the main repeater to you).
Listen to the main repeater directly. With most HTs you'll need to use
an earphone, since most HTs don't mute the sub-band when transmitting on
the main band (Alinco 580s and Kenwood 79s do offer that intelligent
option). Without that muting, you get feedback.

If you can't hear the main repeater directly with your HT, I think you're
out of luck with autopatch.

From: droy@netcom.com
Message-ID: <droyCznrwD.54r@netcom.com>
Source record: 222579

Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.

Thanks for reading this.

Hi all,

I'm considering purchasing a Yaesu 5100.

I own a Yaesu FT 530. Is the 5100 modifiable for out of band operation
like the 530 is? If so, does anyone have the plans to do so?

Is it possible to increase the number of memory channels in the 5100?

Any overall comments on the 5100? Is it a good radio. Pros - cons?!

Thanks for your help.

You can email this info to me directly if desired.

email to clevelan@teleport.com.

Thanks much.

Indoor antennas should never be used no matter how restricted the user
is or how "cute" they look. The safety of these systems leaves much to
be desired from the standpoint of exposure to electromagnetic fields.

>Being a beginner, I am planning to buy a ham radio. What are the things that
>I should pay attention to?

Hi,

Buy the *best* radio you can afford. On HF your main problem
will be large signal capability, and there it is where the money goes.
So, if cash is no problen, consider a TS850 or roundabouts.

Else I should strongly recomend a s/h rig over a "newcommers" job,

I bought a Yaesu FT101B, for about 400$ it has a tube transmitter.
this is tedious when QSY'ing, but saves the antenna tuner.
(tube PA's dont have to be operated into 50 Ohms.)

All HF rigs I have ever come across are capable of transmitting
out of band. Just dont do it.

Good Luck, Moritz DL5UH

>INTERNET: helliott@losat.redstone.army.mil

Your asking too much for "in-band repeat." Think about it... a 50 watt
two meter transmitter operating in the same box as a 2-meter receiver.

Repeaters accomplish this with separate transmitters and receivers, well
shielded from each other, and a large duplexer allowing them to operate
into the same antenna. Without all this hardware, the transmitter
interferes with (or "desensitizes") the receiver.

Our club operates one repeater built from an old mobile phone, so the
receiver and transmitter are in the same box -- but it's a pretty big
box, and the receiver and transmitter are well shielded. Still, we had
to limit the repeater's power output to about 20 watts, and we are using
a large, external duplexer.

The dual-band radios can do "crossband repeat" because it isn't that hard
to filter the transmit RF several hundred MHz away from the receiver.
Filtering that RF just a few hunderd kHz is a much more difficult feat.

There is a company, Sinclair Labs I think, that sells 2m bandpass
filters that consist of four cavities in a box about the size of
a 2m amp. It claims 100dB of suppression of out-of-band signals and
a 1 or 2dB (I think) insertion loss.

They have an ad in the latest issue of CQ.

This is very unlikely. At least on 2M : the tx/rx distance is 600 kHz.
Doing fullduplex (talking to the repeater input AND listening to the repeater

output at the SAME time, that is) on ONE antenne requires at least 6 very
large (1/4 wavelength) cavity's. 3 on the tx side to suppress spourious
on the rx qrg, and 3 on the rx side to suppress the tx qrg.

You need at least 100dB isolation between the tx output and the rx input,
on both frequency's.

> Now, returning to the Tm-733 discussion. My guess is that the 733 does
> not have sufficient isolation to keep its transmitter out of the

i am very sure that is has not enough isolation : Make some calculations :

5W=+33dBm. The receiver operates at -120 dBm. This is a difference of more tha
n
150 dB, or a factor of 1000.000.000.000.000 !

This can only be done with a large tx/rx frequency distance, say 10 MHz at 440
,
and extensive filtering in tuned helical cavity's for mobile use.

Of course you don't need 150 dB isolation between tx and rx, about 100 dB is
enough in most cases : when you take some desensing for granted.
But 100 dB is still a lot !

> receiver. On the other hand, if you had some small amount of desense,
> it might still be useful in some applications. One might try to use
> the CTCSS capability to help keep the radio from locking up. Your

> and receive frequencies will probably be an issue...bigger difference,
> more likely to be less desense. Since the UHF band is wider than
> VHF, I've often wondered if a TM-733 style radio might be able to
> handle cross-banding from the extreme edges of the UHF band...keeping
> in mind the bandplan.)

yes, IF the TM733 had different antenne connections for both receivers !
Then you could use duplexer cavity's. But with only one antenna plug, this
is impossible.

(b.t.w.: the 733 probably does not have 2 receivers, only 2 MF strips...)

: >can operate at full power into any load?

: Good thermal design costs money and/or requires a degree of cleverness
: from the thermal designer that's rare. The IC735 thermal system is
: remarkable in a piece of amateur gear. Its about the best I've seen,
: and it does it without being bulky or noisy.

What really costs money is good RF design. The real challenge is
designing amplifiers that are stable regardless of the load. An
oscillator can easily generate high voltages that can destroy the
transistor by exceeding the breakdown voltages. This is why
transistors suddenly go "POOF" when your antenna falls off.

True, you can have poor thermal design, but you can often
smell this coming!

However, the price of good design is coming down. The HP8510
vector network analyzer is only $40,000. You need something
like this plus some special hardware to handle the high power
to get the data for your computer program. The network analyzer
can also be used to verify the stability of your finished design.
You need a lot of data--particularly with bipolar transistors
which are known for being heavily bias dependent.

While I would not recommend spending most of your life in a EM field
the scientific evidence does not show the hazard of fields at HF
frequencies. There is a strong counter culture that says everything
is bad particularly if it is technical I suspect this is where Mr. Rodman
gets his authoritative information from. If you choose to use an indoor
loop antenna put it in another room or out the window if you can. That
should suffice. Also be sure the dog cat or whatever is not in the same
room with the antenna RF burns.

Another anternative is to use a random wire tuner and ground to the
water system. If you do this make sure the pipes are metal, some of
the new systems are plastic and do not make a good ground.

Anything you do indoors has potential for RFI for your neighbors so
do a lot of testing with your own home electrical stuff to avoid hassles.
A lot of people successfully do HF indoors no reason you shouldn't.

5971. Omni VI receiver noise level

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-22 16:08:24 UTC
From: jmg@tntech.edu
Message-ID: <1994Nov22.100824.5476@atlas.tntech.edu>
Source record: 222592

I recently purchased an Omni VI. I had a Kenwood 850S before this rig. I really like the Omni and it seems to work really well on all modes.

I have one concern. The noise level of the receiver seems extremely high. With the RF knob fully opened there seems to be an S2 or so level of noise even on 20 and 15 meters. If I turn on one of my other rigs, such as my older Argosy II, The noise doesn't seem to be there. The receiver seems to be very sensitive and can really seperate out the signals.. but I am concerned about this noise level.. is it normal.. is something not adjusted right? I have the AGC on.

thanks for any help

Which brings me to a comment the other day about the new ARRL HANDBOOK.
I was saying how much I liked it and this fellow said that there were
no articles on solid state HF linears. He said that that is just like the
ARRL, they are 20 years behind what people are building and wanting to
find articles about. I did not go into all the articles about solid state
xceivers, logic ckts, digital stuff, all pretty much up to date with what
the new (and some w# calls) hams are doing these days. He and a lot of
HF hams are quite interested in solid state replacements for the 811, 813,
4-400, 3-500 etc linears especially for mobile use. A couple of guys I
know are fooling around with cheap fets for use on 160M and 80M. They
can't seem to hit on a reliable design. Mostly breadboard cut and try with
no engineering expertise. I wonder if their problem stems from the lack of
the necessary test equipment and techniques. Other than Motorola RF data
books, indeed there doesn't seem to be too much published for Hams about
1KW solid state amps. Or if there is some theory, it isn't easy for the
amateur to make the transition to a completed project. Usually it goes the
other way, a completed how-to article which leads the builder to some
understanding about the underlying engineering principles involved without
blowing up $300 worth of transistors....they don't even want to use $300
transistors....they want to use stuff they found at a hamfest or $3 parts

or pulls from something. The purchase of the kit to build the Motorola application note amp just is not the answer for these guys.

I don't know about the new models, but my '90 (and I've heard from others
that have had the problem) has this oscillator with a harmonic that falls
right on 146.52. I don't recall how far apart the mulitples are, but
there are several thru the 2M band. I think the oscillator's in the
FM Radio/Cassette/Clock.

Bring you HT to the showroom :)

: >I do with a random wire hooked up to a tuner?

I hooked up about 25 feet of wire and strung it down my hallway along the
ceiling (my wife just loved this ;-)) for my shortwave radio. I thought
what the heck and used my antenna tuner and loaded it up on 40 meters. I
then turned my power down to about 30 watts and asked for a break in a
ongoing QSO. The 2 hams were about 100 miles north of me and about 400 miles
south of me. They both gave me 59 and got a kick out of my setup. So yes
a random wire will work and in some cases surprisingly well. I also had a
10 meter dipole on my ceiling for a short while and ran 25 watts to it. I
worked some DX off that. Outdoors is allways much BETTER but indoors will
at least get you on the air.

: >--
: Indoor antennas should never be used no matter how restricted the user
: is or how "cute" they look. The safety of these systems leaves much to
: be desired from the standpoint of exposure to electromagnetic fields.

Not much evidence to back this up and I'm not saying that to be sarcastic.
Hams have been exposed to strong RF fields for years and there is no evidence
to support that position as the cancer rate among hams is in some cases less
then the general population. I have strong environmental views and if there
was evidence to support the harmfull effects of exposure to EM fields I'd
be the first to crow about it.

A very recent QST shows a picture of a nice looking copper pipe loop antenna (abt 3 ft. dia) mounted on a wall. The article is about making a variable tuning capicitor for previously described loops, but the picture is worth a thousand words. I think it works on 10 and 20 meters but the ARRL antenna book describes loops for many freq. The nice thing about the article is that the tunning is done by sliding 1/2 in pipe in and out of 3/4 in pipe with a sheet of teflon insulation in between - instead of the usual expensive to buy capicitors. Atricle doesn't address harmful RF fields in your living enviornment though.

>some of its equipment? Any other information would be helpful.

Just purchased their 1.5 KW 962C. SWR meter was unadjusted (adjustment not marked on the schematic diagram) and the coil switch sparked to a bolt on 80m at 300W (40m dipole fed by ladderline). Asked for replacement switch from MFJ, and when it did not arrive within 6 days, I sent it back for replacement to AES. The replacement switch arrived the following day. On a new tuner that lacked one screw, I put a plastic sleeves on the coil switch bolts (thanks N4OGW for suggestion), and the tuner works fine. Now it tunes the 40m dipole on 160M without a problem, and with seemingly good efficiency.

Summarizing,it does not have a quality feel like DAIWA or DRAKE but it costs half what alternatives do.

Phil,

I have a 94 Caravan with the 3.3L engine and have had no problems running 45 watts on 2 mtr. I don't have 450, so I cann't tell you if there is a problem there. I brought in DC through the front passenger side door frame. I put a hole in the rubber grommet that is used for the wiring going to the power door locks and windows. You can snake wire down inside the fender to get into the engine compartment. My radio is mounted on a Radio Shack transmission hump mount that is flat on the floor and I use a mag mount antenna.

Hope this helps.

I have done well with an indoor home made loop antenna hanging in the
livingroom of my apartment, running QRP. The MFJ model works well,
but didn't cover 3.5 to 10.5 MHz, so I set out to make my own.

In article <Czo45w.CM@acsu.buffalo.edu>, oopdavid@ubvms.cc.buffalo.edu (D.RODMAN) says:
>Indoor antennas should never be used no matter how restricted the user
>is or how "cute" they look. The safety of these systems leaves much to
>be desired from the standpoint of exposure to electromagnetic fields.

As for Mr. Rodman's comments, you should have more of a concern for fire
or RF burns from an exposed antenna. Resonant antennas produce high RF voltage
with a risk of fire near combustable domestic furnishings or Rf burns to
accidental contact by humans during operation.
But, when the experts finally agree on what's what with electromagnetic fields,
then you can adjust your power level and spacing accordingly.

Regards to all, Lester Wahl, WA9WJB

Sami told you true. And from an operation point of view you'd be spinning
your wheels for nothing... it wouldn't cut the mustard. All the ad proves
is that; (a) if wishes were horses nobody would walk, and, (b) Wayne Green
will print any copy that's paid for.

The Rule of Thumb is simple: If you haven't the facilities... you don't.
Having been stranded in apartments several time during my life I fully
empathize with your plight. With 35 years in AR and 31 in the profession,
I'll tell you true - the dream is in technicolor.

I saw a discussion recently concerning that. Well kind of.

The recommendation was to remove the battery pack while using
external power. Keeps the radio cooler.

its a lot lighter with off too.

Rob.

I'm in the market for a dual-band handheld. I'd like to spend less than $450 on it. Would appreciate comments from those in the know as to which model/vendor offers the most for the money. 2m/440 are the bands of interest to me. I'm thinking of the Icom 21WAT... What others should I be looking at????

Really appreciate any comments.

Hi All,

I'm going to purchase a "top end" mobile dual band (2 meter-70 cm). The question is - which one.

Money is not to much of an objective - performance is.

I've been seriously considering the Yaesu 5100, but have heard a mixed review of it's performance.

It would be preferable that which ever radio I purchase have the ability to be modified for out of band operation.

I currently own a Yaesu FT 530. I like this unit very much.

IF you could help by recommending a radio for me to purchase, I'd be grateful.

You can email me directly with the info if you'd prefer and I'll compile the info I'm sent and post it to this group.

My email is clevelan@teleport.com.

Thanks in advance for your help.

P.S. I'd like it to be able to decode PL tones and generally have at least all of the features of the Yaesu FT 530 +.

Thanks again,

Kenrick E. Cleveland Ph.D.

I've got a 229H 2m in my 93 Caravan with the 3.3L. No problems. I got my DC direct from the battery. I passed the DC cable through a grommet just below the steering shaft on the driver's side. The radio sits on top of the dashboard. That way, when I lock it up in "dangerous" territory, I just quickly disconnect the DC and antenna, then lock the rig in the stowage under the front passenger seat. I use a 1/4 wave with a trunk lip mount drilled into the left front fender. Lots of clearance for the hood to close. I tried a 5/8 mag mount on the roof, but too much of a pain every day folding it over to get into the garage. I also have a 5/8 whip that I interchange with the 1/4 wave for better fringe coverage. Good luck; Terry VE4 UC tcalof@minet.gov.mb.ca

>great; I have had ragchews with JA and VK. Am I hurting the rig or can it
>handle it?

The basic design of the 735, and its protection circuits, are excellent.
It doesn't care what the load looks like. It can drive a short or an
open on the coax without harming itself. Of course it won't get out very
well that way. For full output, you need to get the VSWR down to 2:1 or
less.

Once, in a fit of incredible stupidity, I tried in vain to get a good match on
an open antenna wire. I twisted the knobs on my tuner back and forth for a couple
of minutes before I realized that I hadn't switched on the power to my antenna
relay. I was sure that my IC-735 was toasted, but was relieved to discover that
it didn't appear to be harmed at all.

Subject: Buying a HAM radio

>Being a beginner, I am planning to buy a ham radio. What are the things that
>I should pay attention to?

Hi,

Buy the *best* radio you can afford. On HF your main problem
will be large signal capability, and there it is where the money goes.
So, if cash is no problen, consider a TS850 or roundabouts.

Else I should strongly recomend a s/h rig over a "newcommers" job,

I bought a Yaesu FT101B, for about 400$ it has a tube transmitter.
this is tedious when QSY'ing, but saves the antenna tuner.
(tube PA's dont have to be operated into 50 Ohms.)

All HF rigs I have ever come across are capable of transmitting
out of band. Just dont do it.

Good Luck, Moritz DL5UH

: >I do with a random wire hooked up to a tuner?

I hooked up about 25 feet of wire and strung it down my hallway along the ceiling (my wife just loved this ;-)) for my shortwave radio. I thought what the heck and used my antenna tuner and loaded it up on 40 meters. I then turned my power down to about 30 watts and asked for a break in a ongoing QSO. The 2 hams were about 100 miles north of me and about 400 miles south of me. They both gave me 59 and got a kick out of my setup. So yes a random wire will work and in some cases surprisingly well. I also had a 10 meter dipole on my ceiling for a short while and ran 25 watts to it. I worked some DX off that. Outdoors is allways much BETTER but indoors will at least get you on the air.

: >--
: Indoor antennas should never be used no matter how restricted the user
: is or how "cute" they look. The safety of these systems leaves much to

Not much evidence to back this up and I'm not saying that to be sarcastic. Hams have been exposed to strong RF fields for years and there is no evidence to support that position as the cancer rate among hams is in some cases less then the general population. I have strong environmental views and if there was evidence to support the harmfull effects of exposure to EM fields I'd be the first to crow about it.

From: droy@netcom.com (Dave Roy)
Subject: Kenwood 732.dead.2mtrs

Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to

suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.

Thanks for reading this.

Sami Boulos (sami@bnr.ca) wrote:
: I'd appreciate recommendations for HF antenna tuners, specifically
: the MFJ models (e.g 941E, 945D, 934 etc.) How good is their quality -

There's a saying among hams down south that MFJ stands for "Mississippi's Finest Junk". I knew better but after weighing the alterbntives bought a model 989c. In less than one week it smoked the insultator on one end of the roller inductor. Fortunately its easy to tkae apart. The wire from inductor to the cap was not firmly screwed down and was the culprit. After looking at the beast I decided it was easier to fix myself than return. Ground out the carbon path left by the loose screw and glued an old piece of ceramic insulator in the arae where things were ground out. That fixed that problem.

The spinner handle on roller inductor came loose from the factory and is grinding paint of the front panel.

The stops on the roller inductor are made of RTV, too soft, after 3 months of rolling up to the stop to tune 160 meters the rtv gave up, put a large solder bump in its place.

The moral to the story..save your money buy a top qulaity tuner (NYE VIKING?) or buy an MFJ and resign yourself to having to work on it or better yet go to some hamfests, scrounge some parts , build your own. If my job left me some time to do that The later is my preferred choice

: Hmm. You mean you plug it into the battery pack ? Or the Radio.
: The battery only charges if you plug into the battery pack.

O.K. I'll risk being flamed again. The battery charge circuit in the
HTX-202 and HTX-404 *IS* isolated from the 12V input jack. A schematic
is included with the above radios. Look at it. The charging circuit
is isolated from the 12V input with a Schottky diode. The 12V input is
isolated from the charging circuit with another Schottky diode.
The battery is isolated from the charging circuit with a regular diode
(don't want the charging circuit draining the battery when not active).
The two screws on the bottom of the battery pack, that are marked
+ and - are isolated by a diode.

Now, if I'm wrong, so are the schematic diagrams that I received with
the radios. I definitely have NOT opened a the radio to trace the
circuit.

cheers,

Mike, K0TER

Hi!

Well, the ones with fancy names are quite safe of cause, since they very
effectively absorb the RF power (in fact with the purpose of keeping
the user free of WSWR problems).

There is an increasing lobby here against electrosmog in general and
amateur radio specially. Not suscribing to their views, I should
recomend a random wire or a hb magnetic antenna.

BTW, the maximum permissible RF level is a lot higher at HF than at UHF.

So good luck and DX, Moritz DL5UH

Believe NMO is the same as a "Motorola" mount. If so, 3/4" is the correct size for the hole. The hole is a bit smaller than the outer portion of the mount, so you have to install the thing from the outside of the vehicle. I generally remove the paint around the hole, so that there is DC continuity, but I doubt it really matters.

BUT.......we (guys on 80M) regularly used to talk to a ham in an apt. He
had a big signal with a #28 magnet wire strung around the ceiling of every
room, out the door, down the hall, in the next room, etc. A horizontal loop
with a few bends in it. It worked for him and us in the midwest a few states
around the guy. He used 100 watts. So.....try something.....maybe you'll
hit on a coefficient of friction near 1 after all.

The efficiency of indoor antennas aside, so long as you're not pumping 1kW
into your wire inside your apartment, and you're more than about 1m away
from the antenna, the fields from your antenna passing through your body
aren't going to be much stronger than the fields generated within your cells.

Ask Bob Park at the APS if you don't believe me. Your biggest danger is RF
burns by accidentally touching the antenna while you're on-the-air.

Ne> part # would be appreciated as would any other suggestions.

Ne> If anyone has one to sell I'd like to hear about that too...

Ne> 73...John, KE4RRG

Hi, John. I haven't looked at Radio Shack, but I found one with
no trouble at a local parts store in Raleigh (Capitol Electronics) made
by Fairchild. It was hanging on a pegboard display with a bunch of
other mini and standard DINs, so it's not hard to find. I've also
seen them at hamfests.

I've had my 733 up and running on 9600 for a few weeks, now, with good
success. Be aware that the T/R switching time is about 180 milliseconds,
so if the local 9600 net is switching faster than that (with
Kantronics DataRadios, for example, which can switch in as little as
10 milliseconds), you'll be incompatible.

Also, when you go to connect to the 733, you'll find a pin cryptically
labled "Packet Standby." That's the "Push-To-Talk" line in most people's
vocabularies.

Good Luck

> (off of course without anything on the display). Is this normal?

No it's not normal. I bought my radio in August of 1993. A fully charged
battery would last at least a week if I didn't transmit. Lately the
battery has been discharging in about 30 hours, whether I used the radio
or not. At first I thought the battery pack was going bad but the same
thing happened with another nicad pack as well as with the AA pack. I
measured the DC current from the battery and found it drew 40mA when
turned on and squelched, 35mA when turned off. The manual says that the
current draw when off should be 160 micro amps. The radio is going back to
Yaesu today. Too bad it isn't under warranty like yours is.

Best regards.

From: jon@codewks.nacjack.gen.nz (Jonathan Annett)
Subject: FM SUB CARRIER EQUIPMENT

Product Supply Quotation Request : FM SUB CARRIER DECODING EQUIPMENT

Introduction.

Our company is wanting to locate a supplier of FM sub-carrier decoder units
suitable for detecting and decoding serial data encoded within transmissions
on the fm broadcast band.

Technical Breif.

The unit will be tuned to a single frequency (to be advised) in the FM
broadcast band, ie an FM radio station. It will need to detect and decode a
sub carrier signal present within the station's transmission and convert it
into a serial data output.

Ideally the unit will need to be able handle a data throughput of 4800 bits
per second (4800 baud), and a minimum of 2400 baud is required.

The serial output of the device will be connected to a IBM compatable PC/AT
serial port.
A device that can be connected using a commonly available serial cable is
prefferable, not unlike the type of cable supplied with an external modem.
In other words the unit could either have a 25 pin female D socket or a 9 pin
female D socket, as does an standard external modem, wired in a similar fashio
n.

The unit itself would provide a data output only, and will not be required to
receive any control information from the computer.

The unit has no size or weight restrictions other than that it is to be easily
portable, again not unlike an external modem.

Power supply for the unit can either be AC mains (230-250 volts, 50Hz) or via
an external plugpack unit as per your speclification / supply.

The unit will ideally have an telescopic antenna attached, and a socket for
an external antenna to be connected.

Quantities Involved.

We require aproximately 300 units within the next 2 months, and urgently requi
re
5 units for initial testing as soon as possible, ideally within the next 2 wee
ks

An off the shelf soliution would be preffered as the lead time for turnkey
development may be alternative inapropriate. However, if you feel you can come
up
with a solution within the above time restraints, please don't hesitate to quo
te,
but state that you intend to develop the unit in your quote, by return email.

We are also looking for an in depth custom development of a device for another
application that uses similar technology, but incorporating automatic station
selection technology. If your company is suitablly equipped to take on such a
project, please email us directly and we will send you a detailed specificatio
n
document about that project for your perusal.

From: clevelan@teleport.com
Subject: Help Needed: Which Mobile Dual Bander To Buy?

Hi All,

I'm going to purchase a "top end" mobile dual band (2 meter-70 cm). The
question is - which one.

Money is not to much of an objective - performance is.

I've been seriously considering the Yaesu 5100, but have heard a mixed
review of it's performance.

It would be preferable that which ever radio I purchase have the ability
to be modified for out of band operation.

I currently own a Yaesu FT 530. I like this unit very much.

IF you could help by recommending a radio for me to purchase, I'd be grateful.

You can email me directly with the info if you'd prefer and I'll compile the info I'm sent and post it to this group.

My email is clevelan@teleport.com.

Thanks in advance for your help.

P.S. I'd like it to be able to decode PL tones and generally have at least all of the features of the Yaesu FT 530 +.

Thanks again,

Kenrick E. Cleveland Ph.D.

>jump. Does anyone know anything about how to do this or even if it's
>possible? There's some mysterious contacts on the side of the HT near
>the PTT switch. Any help would be welcome. Thanx in advance.

Moving that radio to the 440 ham band is quite possible. The big deal will be buying crystals...those little plug-in lumps are not just crystals, but also include the oscillator and some compensation as well. Unless you're extremely patient and good at miniaturized circuit work, I'd recommend sending them (they're called channel elements) to International Crystal to be recrystaled and temperature compensated. The only gotcha is the cost: it'll run you about $70 per channel (one receive, one transmit channel element). Outside of that, it's just a matter of tuning it up.

Your radio is the universal model. Those contacts on the side are connections for a speaker-mic or convertacom mobile adapter; the two spring-loaded contacts are receive audio (pressing it in disconnects the internal speaker) and antenna (pressing it in disconnects the internal antenna). Those contacts need to be kept clean inside the radio, and they're a bit hard to get to.

If your radio still has the sticker on the back with the model number, you can tell what its power rating is; if the model number is H24BBUnnnn, then it's a 1-watt radio, while H34BBUnnnn is 5 watts. The PA module on the 5 watt radio extends into the back frame (it's the one screwed to the metal

frame right above the PTT).

Good luck. I have one on the 440 band, and it works fine. It's almost
completely immune to intermod, thanks to the helical front end, and has all
the receive audio you'd ever want. Mine is also _yellow_, but that's another
story...

From: Gerald Schmitt <ggs@aerie.lanl.gov>
Subject: Indoor HF antenna recommendations

While I would not recommend spending most of your life in a EM field
the scientific evidence does not show the hazard of fields at HF

frequencies. There is a strong counter culture that says everything
is bad particularly if it is technical I suspect this is where Mr. Rodman
gets his authoritative information from. If you choose to use an indoor
loop antenna put it in another room or out the window if you can. That
should suffice. Also be sure the dog cat or whatever is not in the same
room with the antenna RF burns.

Another anternative is to use a random wire tuner and ground to the
water system. If you do this make sure the pipes are metal, some of
the new systems are plastic and do not make a good ground.

Anything you do indoors has potential for RFI for your neighbors so
do a lot of testing with your own home electrical stuff to avoid hassles.
A lot of people successfully do HF indoors no reason you shouldn't.

A very recent QST shows a picture of a nice looking copper pipe loop
antenna (abt 3 ft. dia) mounted on a wall. The article is about making a
variable tuning capicitor for previously described loops, but the picture
is worth a thousand words. I think it works on 10 and 20 meters but the
ARRL antenna book describes loops for many freq. The nice thing about
the article is that the tunning is done by sliding 1/2 in pipe in and out
of 3/4 in pipe with a sheet of teflon insulation in between - instead of
the usual expensive to buy capicitors. Atricle doesn't address harmful
RF fields in your living enviornment though.

>Being a beginner, I am planning to buy a ham radio. What are the things that
>I should pay attention to?

Hi,

Buy the *best* radio you can afford. On HF your main problem
will be large signal capability, and there it is where the money goes.
So, if cash is no problen, consider a TS850 or roundabouts.

Else I should strongly recomend a s/h rig over a "newcommers" job,

I bought a Yaesu FT101B, for about 400$ it has a tube transmitter.
this is tedious when QSY'ing, but saves the antenna tuner.
(tube PA's dont have to be operated into 50 Ohms.)

All HF rigs I have ever come across are capable of transmitting
out of band. Just dont do it.

Good Luck, Moritz DL5UH

: >I do with a random wire hooked up to a tuner?

I hooked up about 25 feet of wire and strung it down my hallway along the ceiling (my wife just loved this ;-)) for my shortwave radio. I thought what the heck and used my antenna tuner and loaded it up on 40 meters. I then turned my power down to about 30 watts and asked for a break in a ongoing QSO. The 2 hams were about 100 miles north of me and about 400 miles south of me. They both gave me 59 and got a kick out of my setup. So yes a random wire will work and in some cases surprisingly well. I also had a 10 meter dipole on my ceiling for a short while and ran 25 watts to it. I worked some DX off that. Outdoors is allways much BETTER but indoors will at least get you on the air.

Not much evidence to back this up and I'm not saying that to be sarcastic. Hams have been exposed to strong RF fields for years and there is no evidence to support that position as the cancer rate among hams is in some cases less then the general population. I have strong environmental views and if there was evidence to support the harmfull effects of exposure to EM fields I'd be the first to crow about it.

From: droy@netcom.com (Dave Roy)
Subject: Kenwood 732.dead.2mtrs

Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.

Thanks for reading this.

Sami Boulos (sami@bnr.ca) wrote:
: I'd appreciate recommendations for HF antenna tuners, specifically
: the MFJ models (e.g 941E, 945D, 934 etc.) How good is their quality -

There's a saying among hams down south that MFJ stands for "Mississippi's
Finest Junk". I knew better but after weighing the alterbntives bought a
model 989c. In less than one week it smoked the insultator on one end of
the roller inductor. Fortunately its easy to tkae apart. The wire from
inductor to the cap was not firmly screwed down and was the culprit.
After looking at the beast I decided it was easier to fix myself than
return. Ground out the carbon path left by the loose screw and glued an
old piece of ceramic insulator in the arae where things were ground out.
That fixed that problem.

The spinner handle on roller inductor came loose from the factory and is
grinding paint of the front panel.

The stops on the roller inductor are made of RTV, too soft, after 3 months
of rolling up to the stop to tune 160 meters the rtv gave up, put a large
solder bump in its place.

The moral to the story..save your money buy a top qulaity tuner (NYE
VIKING?) or buy an MFJ and resign yourself to having to work on it or
better yet go to some hamfests, scrounge some parts , build your own. If
my job left me some time to do that The later is my preferred choice

You may hurt your rig or not, depending how well it is designed.
Anyway, this does not matter, at least to the rest of the world.
What matters indeed, is that depending how the ALC or fold back
operates, you may end up putting out a considerable amount of splatter.

So you should better get your antenna fixed.

I don't know about the new models, but my '90 (and I've heard from others
that have had the problem) has this oscillator with a harmonic that falls
right on 146.52. I don't recall how far apart the mulitples are, but
there are several thru the 2M band. I think the oscillator's in the
FM Radio/Cassette/Clock.

Bring you HT to the showroom :)

6012. Yaesu FT530 Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-24 01:50:23 UTC
From: mweitzen@coho.halcyon.com
Message-ID: <3b0rgv$d05@news.halcyon.com>
Source record: 222536

I am somewhat new to the world of Amateur Radio so I hope this doesn't sound to silly. I have an FT530 and have been reading all of the posts about the mods (cutting the green wire, etc.) but my question is WHY does want want to do this? I am sure there must be a good reason. The 2nd question is if the mod to extend the receive and xmit range is successful, what is th performance like?

Thanks

KC7FAA

3/4"

Automotive and hardwear retail stores have "step-up" drills for
sheet metal holes. Get the one with a max dia. of 3/4" <.750>.

I have one of these drill bits and it has not let me down. I used
a hole saw to install a ball mount for my HF antennea and had only satisfactory
results even with a high quality high-speed-steel cutter.

clevelan@teleport.com wrote:
: Hi All,

: I'm going to purchase a "top end" mobile dual band (2 meter-70 cm). The
: question is - which one.
: Money is not to much of an objective - performance is.

I've spent a while looking for a new 145/130 MHz radio. I've changed my car and would find a remote-panel job easier to fit and hide. My prime objective was to equal or better my existing radio. My search is over, I've reached a conclusion. I got hold of a variety of candidate radios and actually measured their performance.

: I've been seriously considering the Yaesu 5100, but have heard a mixed
: review of it's performance.
: It would be preferable that which ever radio I purchase have the ability
: to be modified for out of band operation.

This blows your performance objective right out of the water, I'm afraid. Radios that can be modded for out-of band receive have either wide open front ends, or else a varactor-tuned front end filter. These are both far inferior to the older style fixed amateur band only front-ends. Even if you don't do the mod, you still get the overload, blocking and intermodulation disadvantages - all the mod does is change a software limit on the frequency data that can be sent to the synthesiser.
Transmit sides are usually OK, but on this class of radio, you won't be far wrong if you think of a nasty scanner having replaced an optimised receiver.

: I currently own a Yaesu FT 530. I like this unit very much.

You may find it acceptable on a small antenna, or if you live in an area with little use of the surrounding spectrum, but you may find it interesting to try the effect of a large antenna in a busy environment.

: IF you could help by recommending a radio for me to purchase, I'd be grateful.
: P.S. I'd like it to be able to decode PL tones and generally have at least
: all of the features of the Yaesu FT 530 +.

Your mention of performance makes this difficult. There has been a general change of target for VHF/UHF radios over the past several years. The majority of amateurs have become more knowledgable of features like crossband repeat, coded squelch, remote control etc etc, and less knowledgable about basic radio performance. The manufacturers have responded with boxes containing more bells and whistles, more

conveniences and better ergonomics but less radio. This is not intended as criticism of most amateurs, for it takes access to decent test equipment to spot these problems, or careful A/B tests in demanding conditions. Just trying a single radio doesn't show up a compromised receiver. If you can't hear something you probably never know.

I've looked, I've looked hard. I've found nothing that isn't outperformed by my old TW4000A. I discussed this with the main UK trio/kenwood importer at a rally last Sunday, and they said they could offer nothing to replace it with equal RF performance. I think I'll order up a new front panel to smarten it up again and bite the bullet.

Your choice is whether the features you like balance a drop in the ability to receive if there are other signals about.

I'm sorry, but there isn't much choice to be had, they all seem to have gone the more-gameboy, less-radio route. I too would enjoy the advanced features, but I'd like to keep the full radio performance.

Cheers
David GM4ZNX

Hi!

Well, the ones with fancy names are quite safe of cause, since they very
effectively absorb the RF power (in fact with the purpose of keeping
the user free of WSWR problems).

There is an increasing lobby here against electrosmog in general and
amateur radio specially. Not suscribing to their views, I should
recomend a random wire or a hb magnetic antenna.

BTW, the maximum permissible RF level is a lot higher at HF than at UHF.

So good luck and DX, Moritz DL5UH

Indoor antennas should never be used no matter how restricted the user
is or how "cute" they look. The safety of these systems leaves much to
be desired from the standpoint of exposure to electromagnetic fields.

BUT.......we (guys on 80M) regularly used to talk to a ham in an apt. He
had a big signal with a #28 magnet wire strung around the ceiling of every
room, out the door, down the hall, in the next room, etc. A horizontal loop
with a few bends in it. It worked for him and us in the midwest a few states
around the guy. He used 100 watts. So.....try something.....maybe you'll
hit on a coefficient of friction near 1 after all.

Subject: NMO Hole Size?

Believe NMO is the same as a "Motorola" mount. If so, 3/4" is the correct
size for the hole. The hole is a bit smaller than the outer portion of
the mount, so you have to install the thing from the outside of the
vehicle. I generally remove the paint around the hole, so that there is
DC continuity, but I doubt it really matters.

: Hmm. You mean you plug it into the battery pack ? Or the Radio.
: The battery only charges if you plug into the battery pack.

O.K. I'll risk being flamed again. The battery charge circuit in the
HTX-202 and HTX-404 *IS* isolated from the 12V input jack. A schematic
is included with the above radios. Look at it. The charging circuit
is isolated from the 12V input with a Schottky diode. The 12V input is
isolated from the charging circuit with another Schottky diode.
The battery is isolated from the charging circuit with a regular diode
(don't want the charging circuit draining the battery when not active).
The two screws on the bottom of the battery pack, that are marked
+ and - are isolated by a diode.

Now, if I'm wrong, so are the schematic diagrams that I received with
the radios. I definitely have NOT opened a the radio to trace the
circuit.

cheers,

Mike, K0TER

Which brings me to a comment the other day about the new ARRL HANDBOOK.
I was saying how much I liked it and this fellow said that there were
no articles on solid state HF linears. He said that that is just like the
ARRL, they are 20 years behind what people are building and wanting to
find articles about. I did not go into all the articles about solid state
xceivers, logic ckts, digital stuff, all pretty much up to date with what
the new (and some w⌿ calls) hams are doing these days. He and a lot of
HF hams are quite interested in solid state replacements for the 811, 813,
4-400, 3-500 etc linears especially for mobile use. A couple of guys I
know are fooling around with cheap fets for use on 160M and 80M. They
can't seem to hit on a reliable design. Mostly breadboard cut and try with
no engineering expertise. I wonder if their problem stems from the lack of
the necessary test equipment and techniques. Other than Motorola RF data
books, indeed there doesn't seem to be too much published for Hams about
1KW solid state amps. Or if there is some theory, it isn't easy for the
amateur to make the transition to a completed project. Usually it goes the

other way, a completed how-to article which leads the builder to some understanding about the underlying engineering principles involved without blowing up $300 worth of transistors....they don't even want to use $300 transistors....they want to use stuff they found at a hamfest or $3 parts or pulls from something. The purchase of the kit to build the Motorola application note amp just is not the answer for these guys.

The Worcester Polytechnic Institute Wireless Association is
considering purching or receiving a new computer (donations welcome)
for our station, W1YK.

We would like to purchase software for logging with the following
options:

1. Contest software: supports alot of contests, easy to use and
reliable. Please comment on software for both dos and windows.
Also supports Kenwood rig interface, and packet cluster.

2. Station logging software: reliable, supports Kenwood rig control,
and packet cluster. Comment on both windows and dos programs.

I am interested in hearing what others are using for software and
comments about it.

Thanks for your help. 73.

Randy Lott (rrl@inetinc.com) wrote:
: I am looking for information on what VLF receivers are available on the
: surplus market.
: My interest is NDB DXing and 1750 meter work.

I rarely see VLF receivers at surplus traders, although someone, last month, gave our local club an Eddystone VLF receiver which needs a re-build.

There have been plenty of VLF converter designs published, they usually work with a normal HF receiver. If you already have an HF receiver, this is likely your best approach. Some kit suppliers sell VLF converters.

The biggest problems are the need for screening the converter, and having a well-screened HF receiver to keep out HF signals.

A modern, synthesised, stable, HF rx and a crystal controlled converter can be a lot easier to use than an elderly VFO-tuned analogue dial'd monster if you are seeking narrowband things at precise frequencies. It all depends on if you already have a suitable receiver.

The Kenwood has more Game Boy features, but the Yaesu is a better
radio, though neither is a great radio in high RF areas.

>want want to do this? I am sure there must be a good reason.

Why? So they can annoy the local police department, or chat with the McDonalds clerks over the radio, or access their commercial work repeater, or a GMRS system. Of course it's illegal to do any of those things, and it annoys the police, McDonalds, and the FCC, but maybe having a felony record will impress their buddies.

There are a limited number of legitimate reasons too. 1) MARS/CAP operation, though the radios usually will cover these without modification, 2) to drive a microwave transverter, though a SSB rig would likely be more useful, 3) to BE PREPARED for that once in several lifetimes chance when an emergency occurs that invokes the FCC "by any means" rule, though you may still get in trouble with the police. The FCC rule just saves your license, it doesn't pre-empt interference with an officer charges by the police dept. They consider their radio systems critical to safety of life (their police officer's lives) and don't take kindly to civies showing up on the channel.

>The 2nd
>question is if the mod to extend the receive and xmit range is
>successful, what is th performance like?

Perfomance out of band ranges from fair to very poor depending on where out of band you measure it. Now be nice and don't heckle the National Weather Service when they get the forecast wrong again.

Mike, The Hammerlund HQ170a was a fine tube type receiver. The price is
about right. If it's in good shape it will make a super good hf rig.
the single sideband reception, in my opinion, is as good as my new Drake R8.
and it is easyer to tune in ssb with the BFO. I am looking for one myself.
Well thats my $.002 worth.

>Is that the identical company?

National radio was an american company that made tube type receivers.
They, along with Hammerlund and Halicrafters, were forced out of business
by Japanese competition. I had all three types of radios and my National
NC190 was a very nice general coverage unit. The Hammerlund HQ180 was
even better. These old machines will still hold their own with much
of the new stuff including my new Drake R8.

Oh????????? is that right? You mean that Drake, Collins, Heath, etc.
which were substantially more dominant in the late 60s and early 70s
than the JA manufacturers, had relatively no effect? I would submit
that competition from other domestic (US) suppliers significantly
greater than from Tempo (Yaesu), Trio (Kenwood) and Icom.

BTW, to this day - the Drake C-line and the Collins S-Line are highly
sought after (at big $ pricing) by many Japanese hams who always
dreamed of those rigs as being the epitome of technology and presitige.

Some people, (not necessarily me) have even suggested that the
implementation of incentive licensing in 1968 had a large impact on
the growth of the ham population and hence the market for such rigs.

Motorola's hole saw is slick, as described in the other posts...I have been using the same one for abt 2 years with no appreciable dulling yet.

FYI, you can install an NMO base from the outside. It was designed to be slipped in sideways (drop the coax thru first) for vehicles with multiple layers in the sheet metal. Give it a try.

Gee, how did Motorola and GE design all that gear before fancy
network analyzers and computer simulations? The same way hams
could, I expect. They used conservative design rules, and lots
of bench testing.

Give that man a cigar! When the ham market weakened substantially,
the weaker companies were squeezed out. Several were gone within
3 years after 1968 put the brakes on the US market. The final coup
de grace for most of them was the switch from vacuum tubes to solid
state, however. Most of the old line companies didn't have designers
versed in solid state design, and couldn't rapidly adapt to a shrinking
market with higher expectations. One bad rig and they were history.

The Japanese, because the US market is substantially smaller than
their protected home market, were able to weather the transition
better, and became the dominant players, as they did in most other
consumer electronics. It didn't hurt that they plan for the long
term and were willing to eat substantial losses to gain the long
term marketplace.

Oh, and a note about the NC-190, the drift-o-matic was a horror
compared to Drakes, even the 1A. Been there, done that, got the
Tee shirt.

6042. Re: NMO Hole Size?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-25 05:22:59 UTC
From: q@wx8l.tacom.army.mil
Message-ID: <3b3sbj$t1h@VTC.TACOM.Army.Mil>
Source record: 222468

Jerry Gardner x323 (jerry@isi.com) wrote:

: Anyone remember the hole size for an NMO mount? I'm thinking of using
: a Greenlee chassis punch to make the hole. Is this the preferred method,
: or is there a better way?

3/4" as others have noted.

At my shop, we have hole saws with and without the stop ring, and step bits,
but the prefered method is a Greelee chasis punch.
Obviously you must have clearance on the back side, but I wouldnt be too
concerned with scraping the paint around the hole (on top) as the mount
has teeth that bite into the metal on the underside.
We do hundreds of installs a year, police, fire, and local govt., vhf low, high,
UHF and 800, and this technique has served us well.

Here is something COMPLETELY different from the usual technobable... forget intermods, HTX-202, out of band mods, antenna tuners.... the real questions are as follows:

WHY ASK WHY?

Why do you need a driver's license to buy liquor when you can't drink and drive?
Why isn't phonetic spelled the way it sounds?
Why are there interstate highways in Hawaii?
Why are there flotation devices under plane seats instead of parachutes?
Why are cigarettes sold in gas stations when smoking is prohibited there?
Why do Amateur Radio operators sacrifice performance for bells and whistles in the radio products they buy?
Do you need a silencer if you are going to shoot a mime?
Have you ever imagined a world with no hypothetical situations?
How does the guy who drives the snowplow get to work in the mornings?
If 7-11 is open 24 hours a day, 365 days a year, why are there locks on the doors?
If a cow laughed, would milk come out her nose?
If nothing ever sticks to TEFLON, how do they make TEFLON stick to the pan?
If you tied buttered toast to the back of a cat and dropped it from a height, what would happen?
If you're in a vehicle going the speed of light, what happens when you turn on the headlights? What would happen if you keyed your transceiver?
You know how most packages say "Open here." What is the protocol if the package says, "Open somewhere else"?
Why do they put Braille dots on the keypad of the drive-up ATM?
Why do we drive on parkways and park on driveways?
Why is it that when you transport something by car, it's called a shipment, but when you transport something by ship, it's called cargo?
Why is it important to have 0.2 microvolt sensitivity in a receiver that operates in a 1.0 microvolt city noise environment?
You know that little indestructible black box that is used on planes? why can't they make the whole plane out of the same substance? (or HT's?)
Why is it that when you're driving and looking for an address, you turn down the volume on the radio?
Why don't they have National Amateur radio CAR SLALOM course, navigating your standard transmission vehicle on a difficult course while simultaneously talking on VHF, changing the frequency on UHF, and performing an autopatch, all while it is snowing?
Do you know who in 1923 was:
1. President of the largest steel company?
2. President of the largest gas company?

3. President of the New York Stock Exchange?
4. Greatest wheat speculator?
5. President of the Bank of International Settlement?
6. Great Bear of Wall Street?
These men should have been considered some of the world's most successful
men. At least they found the secret of making money. Now more than 55 years
later, do you know what has become of them?
1. The President of the largest steel company, Charles Schwab, died a pauper.
2. The President of the largest gas company, Edward Hopson, is insane.
3. The President of the N.Y.S.E., Richard Whitney, was released from prison
to die at home.
4. The greatest wheat speculator, Arthur Cooger, died abroad,penniless.
5. The President of the Bank of International Settlement shot himself.
6. The Great Bear of Wall Street, Cosabee Rivermore, died of suicide.
The same year, 1923, the winner of the most important golf championship,
Gene Sarazan, won the U.S. Open and PGA Tournaments. Today he is still playing
golfand is solvent.

CONCLUSION: STOP WORRYING ABOUT BUSINESS AND START PLAYING GOLF! (or mod HAM
radios to act as scanners)

This letter originated in The Netherlands, has been passed around the world
at least 20 times, bringing good luck to everyone who passed it on.
The one who breaks the chain will have bad luck. Do not keep
this letter. Do not send money. Just have your wonderful, efficient cpu
make five additional copies and send it to five of your friends to whom you
wish good luck. You will see that something good happens to you four days
from now if the chain is not broken. This is not a joke. You will receive
good luck in four days.

Feel free to add your own thought provoking wonders to the list.

6046. New Yaesu Dual Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-25 23:40:13 UTC
From: gianotti@aol.com
Message-ID: <3b5skt$dfk@newsbf01.news.aol.com>
Source record: 222473

Anyone have any information on the new Yaesu dual band HT? I think the model number is the FT41R. Supposed to have alphnumeric display, along with spectrum scope, and other neat goodies including the display mike from the FT-530. Looks even better than the new Kenwood (and you can lock out a memory from scan).

>state, however. Most of the old line companies didn't have designers
>versed in solid state design, and couldn't rapidly adapt to a shrinking
>market with higher expectations. One bad rig and they were history.

Actually, I believe it's not all that gloomy. If I remember right, many of the manufacturers simply gave up on the ham radio market and went to other pursuits (not all of which were successful for them, but none of which was as expensive as making ham radio equipment). National Radio, the original subject, is a good example; they were (I believe) the first on the market with a (nearly) all solid-state transceiver, the HRO-500 (?). I used to look at it in the catalogs and drool, then go back to my NCX-3 (probably just as good, but not nearly the bells and whistles). They got out of the biz before I saw my first Yaesu, but I'm not sure whether they were out before Yaesu hit the market big-time.

In any event, I believe that Swan and Hallicrafters bit the dust, and National, Drake and Galaxy left voluntarily to do other things. (Memory QSB... who else was out there?)

A list of features from a New Product Information spec sheet

Simple Scrolling Menu Guide
Real Time Spectrascope display
Alpha-Numeric display
DTMF paging w/ CW caller ID
Cloning
Flexible volume control
Scanning light system
Smart Mute
Digital Volume control
Flexible Sub Operation Button
Built-n DTMF Decoder
Covers 110-180, 420-470 RX, 110-136AM, ham Tx
120 Memories
5 power levels
Cross-band repeat
Digital Battery Voltage
3 dual receive configurations (VV,UU,UV)
Tx, RX battery savers
2W at 4.8V, 5W at 9.6V
etc
.
.
.
The display mike is part MH-29

the size listed for the "2 Watt version" is under 5 inches high

6052. 2 Meter HT Advice Neede

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-26 06:08:04 UTC
From: Dave & Jim Withrow <withrowd@delphi.com>
Message-ID: <Zi9UVY0.withrowd@delphi.com>
Source record: 222478

Hi all,
I'm soon going to join the Ham community. However, for the moment,
most of my operation, due to scheduling problems (I'm a full time college
student & I work 30-35 hrs/wk.), will be 2 meters mobile and 'pedestrian
mobile'. Therefore, I would like to purchase a HT. But, since there is such
a wide variety of rigs out there, I need some help. The rig I'm looking for
needs to at least meet these specs:
1. PL encode (most all the machines around here use it.)
2. DTMF keypad
3. Connections for speaker-microphone
4. At least 5 W RF output
5. Price between $250-$275 (all I can afford.)

If anyone knows of rigs that meet these specifications, please post
or email your experiences with them. Are they easy to use? Reliable? Durable?
I'm currently leaning
toward the RS HTX-202. Any comments about that one?

73's/Thanks

Jim

6053. HTX 202 deviation?

Newsgroup: rec.radio.amateur.equipment

From: dcameron@unixg.ubc.ca
Message-ID: <3b6kmo$kqt@nnrp.ucs.ubc.ca>
Source record: 222479

Hello there fellow hams.

I have a question concerning the RS HTX-202. I know that it is a
wonderful radio and has a great receiver in it.

I have been a 2M operator now for about 1 year and have heard many
handhelds on the air, both on simplex and on repeaters.

I have noticed that our budget radio, the HTX-202 has, only at times, an
extremely low deviation.

I find this annoying when talking to more than one station in a group and
I constanly have to turn up my volume to hear the person with the 202 but
have to turn down my volume so I don't get hearing damage from the
others. I am not the only one who has expressed this concern.

I am located in Vancouver, Canada so this mighrt just be a local problem?!

Please send mail to the newsgroup for discussion..

PR>Anybody out there have any input on putting a 50 watt 2m/440 mobile in
>a current model of a Dodge Caravan? Any hidden gotchas? Any hints?

Take the unit with you to the dealership. Try it out with a mag mount.
With the engine idling. If there's no "ham-aware" salesperson on the
lot, they should be able to refer you to someone in the company who is.

Oh, and if they balk at you trying out your rig in this manner, go
elsewhere to buy the car.

[Article crossposted from rec.radio.amateur.misc]
[Author was]
[Posted on 26 Nov 1994 00:46:44 GMT]

After enjoying s'wave for years, I'd like to buy a transceiver. Used. My requirements are (I think):

HF
with pretty good full coverage receiver
digital display
less than $500 used
CW not important
All ham bands
I'm not an engineer-type, so my romantic feeling for old or complex gear is not strong.

I have it narrowed to: IC-725, 735, 720a; TS-140S, 430S, 530S; FT-747GX, 757GX.

Am I missing any? or are their any on that list that I should NOT be considering?

A thousand thanks to any Surrogate-Elmers out there to help me with this first step.

Gerry

6057. Re: Info on Yaesu FT 5100 Needed - Please Help

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-26 18:00:57 UTC
From: SXSK28A@prodigy.com
Message-ID: <3b7t4p$2s2g@usenetp1.news.prodigy.com>
Source record: 222482

I have the FT5100 and like it very much. Clean, powerful audio, low intermod, sensitive receiver. Yes, it can me modified for out of band. There is an instruction set on Compuserve on HAMNET; it's not easy to do, since it involves soldering wire jumpers on a relatively inaccessible board, but I did it and it worked. QST had an article a while back comparing 2 mtr radios and rated this one very highly. Hope this helps.

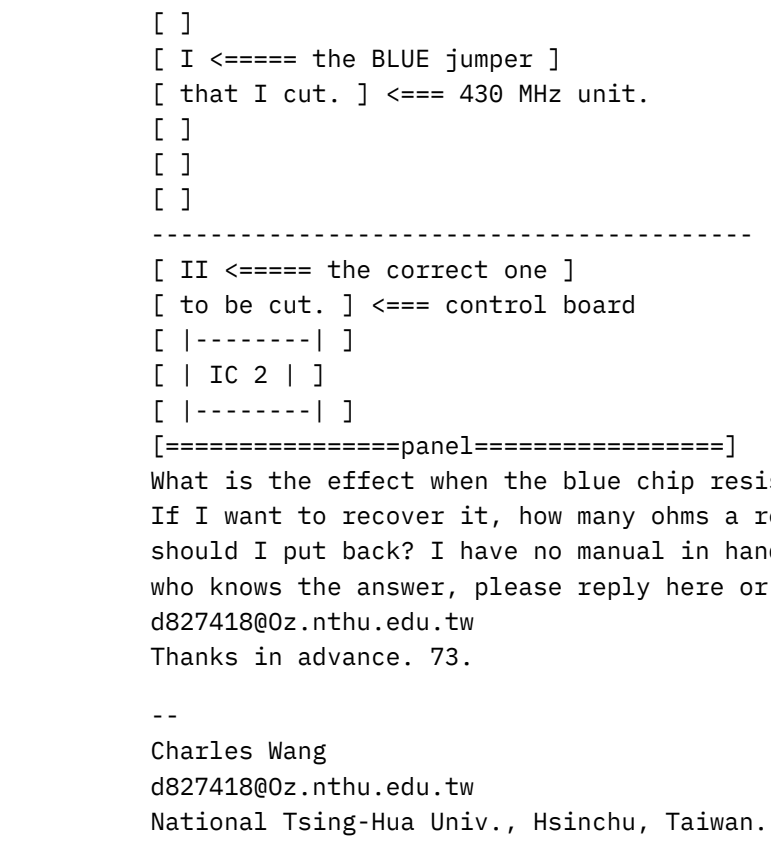
From: d827418@Oz.nthu.edu.tw
Message-ID: <3b9dme$eke@Emerald.Oz.nthu.edu.tw>
Source record: 222494

I cut the wrong jumper resistor on my TM-741A when doing
cross-band repeater mods. It is said that the mods requires
removal of a BLUE 0-ohm jumper on the bottom side of the
control board, but the ONLY blue jumper in my TM-741A was on
the 430 MHz unit, and I just cut it. (How foolish I am!)



What is the effect when the blue chip resistor is cut?
If I want to recover it, how many ohms a resistor
should I put back? I have no manual in hand, so anyone
who knows the answer, please reply here or E-mail to
d827418@Oz.nthu.edu.tw
Thanks in advance. 73.

From: James.Callaghan@Microserve.com
Message-ID: <94112750536@microserve.com>
Source record: 222400

A bit of warning - the problem is NOT in the DEViation of your radio !!
deviation is YOUR tx audio - you may have an AGC problem , but most
likely are listening to radios with significant differences in THEIR deviation.
More detailed info would be needed to determine - such as: are you using
repeaters or simplex ? how distant are the stations ? their power ? etc.
RULE #1 -DON'T MESS WITH THE DEV. it requires EXPENSIVE equiptment to
do it right and the FCC or DOC will have a "kitten" if you do it wrong !

A couple of problems:
You will not have any range on you signal. The inside of a vehicle is no
place for an antenna. Get one outside!
Second your signature file is too much. Graphics can be cute but the excess
data is rude.

What has to be done to an IC-2700 to allow it to receive out of band, i.e, up in the 150-160 MHz range? Does this require a mod? I'm asking this for a friend who says the radio won't do this out of the box.

: I'd appreciate recommendations for HF antenna tuners, specifically
: the MFJ models (e.g 941E, 945D, 934 etc.) How good is their quality -

I've had experience with three 949Es: One I bought on behalf of YN1TV in Nicaragua, one I took to Nicaragua for my own use at YN1ASW, and one I use here at home at N1AW. I have had no problems with mine and YN1TV has had similar experience.

That said, I have heard of experiences with poor quality control at MFJ and have seen it myself in an antenna bridge I purchased second hand. I made a point of taking the cover off and inspecting the antenna tuners for evidence of poor soldering upon receipt. The units I saw were allproperly soldered. I have no complaint about the quality of the components.

The problems I had with the antenna bridge were due to a very poorly made circuit board. The traces were in broken in some places and the component mounting holes were not properly lined up with the traces.

From my experience and what I have heard I would treat an MFJ unit like a used Heathkit: I would be reasonably sure of the design and component quality, but I would carefully check the asembly work.

If this refers to the DR-MO6, then I have had one for about a month now. The receiver is very hot, and the rest of it performs to specification and expectations.

I'm not sure what else you could expect :-)

>can't imagine any problem, I don't want to find out via a $1,000 mistake!

I run 50 Watts in my 1991 Toyota Trecel every day. No trouble.
Just wire things properly if your running high power. Run
the rigs power cables DIRECTLY to the battery and avoid entirely
the automobile's electrical system. Run coax at right angles to
any automotive wiring that will be crossed. Don't mount the rig closer
than maybe a foot to the engine computer (located behind the center
console just below the AM/FM/Cassette in my car).

I certainly can't see an HT causing any trouble.

BTW, I've had equally good results in my 1992 Honda Civic.

Just use common sense. If your going to attempt to run 50 Watts
powered from the cigarette lighter, your ASKING for trouble.

6080. Omni VI Receiver noise

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-27 19:44:57 UTC
From: jmg@tntech.edu
Message-ID: <1994Nov27.134457.5578@atlas.tntech.edu>
Source record: 222402

I posted a while back about Omni VI receiver noise.

well I was going to the Smokeys anyway.. so sidetracked to the Ten Tec Factory. Decided to bring both my Omni and my old Argosy II. I asked if I could hear their Omni.. took about 3 seconds to realize there was something wrong with mine.. theirs was VERY quiet. so left them both my rigs to redo. Receiver noise is not nrmal.. the Omni VI is very sensitive and very quiet.(which is the reason I bought it in the first place). I got mine used from HRO at a good price.. so hopefully won't cost too much to put the rig the way it should be.

I thought that I too, had this problem a year ago when I got mine. Sent
it back and factory said that deviation was fine. Unfortunately, very
low "output" exactly as you describe persisted.
I very knowledgable friend, who used to be a bench tec, took mine apart
and adjusted the mic gain, not the deviation, by transmitting with an
Icom and then with the 202 until the recieved signals sounded the same to
a third radio in the same room. There appeard to be only two adjustment
pots inside when you split the cases and one of them - I THINK-the bottom
right of the case-was the mic gain adjustment. Maybe RS will do this for
you if you tell them the mic gain is set way to low. Have used mine for a
year now and have been totaly pleased.

Thanks Tom, Arnie Espoto at QST did attempt to solve the problem
but he did not get any results other than the company sending me
a fax that they would not reply to any further calls about it.
since then QST HAVE RECEIVED OTHER COMPLAINTS. I really dont
hold much confidence in ARRL magasines, they get revenue from
advertizers and they are in the advertizing business. It will
need as many complaints as possible hitting QST before they
finally can this company.. I personally belive the local
state authorities will put them out of business before QST
refuses their Advertising. This company has a reputation for
carrying guns (PRESTON FUNK) and not answering calls from
unhappy customers.. DONT EVER SEND ANYTHING TO TREVOSE PA.
It may never come back or you will pay big money to retrieve it.
I am told they are also called CROOKEDTRONICS.
AMETRON belive it or not recomended them but wont help when
I complained. Ametron tell me they are not exactly happy and
have ceased all dealings with them.. KENWOOD
KENWOOD refuse to admit they even know them ! This I find strange
when QST carrys an ad looking like it is a KENWOOD REPAIR CENTRE
```

When in fact it is good old CROOKEDTRONICS in Trevose.
Anyway I want to hear from anyone no matter how long ago it
happened who has been ripped off by TREVOSE PA also using
Hamtronics (Not to be confused with Hamtronics Inc NY
or East Coast... 73's Roger VE3XVK 613 387 3080 anytime.

Mike: I have both the Heath SB-401 xmtr and the SB-303 rcvr. Also, I have a
Heath SB-101 transceiver. Heath made a line of receivers, xmtrs, and xcvrs. I
forget all the model numbers but they are still good pieces of eqpt for
beginers -- you can get them moderate prices -- and I keep mine as standby.
The old eqpt does use vacuum tubes. These are devices about which lots of
young guys know nothing. What's a vacuum tube? The drawback to the old gear
is that it uses tubes. Tubes generate lots of heat, use of lots of
electricity, and the eqpt requires a warm-up period before it really stabilizes
in frequency.
Anyway, you asked about cost. I live in northern Virginia, about 35 miles from
Washington, DC. At hamfests here, the SB-401 xmtrs sell for $175 to $275,
depending on condition, manuals present, etc. An SB-303 rcvr wil sell for $200
to $300, depending on condition. The SB-303 is an all solid-state receiver; it
was the first Heath eqpt to use all transistors.
If you are shopping for one, both of them have built-in power supplies. The
SB-303 requires an external speaker or headphones. And, spare parts may be
tough to get. Both use a Heath LMO (linear master oscillator) to generate the
oscillator frequencies needed by the mixer circuits. The old Heath LMO is

rugged and lasts a long time but, if it fails, you may have a problem finding a replacement. If you plan to get into the old Heath gear, keep your eye out for junked SB-400, 401, 300, 301, 100, 101 as they all use the same LMO. I keep a few trashed ones around for parts. Getting replacement tubes can be a challenge, too. Shop the pages of the ham magazines for suppliers.

Colin: I have a SB-401 with manual. Manual says "high impedance microphone."
I use something like a 2,000 ohm crystal mike with mine. For manuals, suggest
you write to: Hi-Manuals, Box L-802, Council Bluffs, Iowa 51502. They wil
send you a catalog ($2 to US address, $3 to address outside US). This guy has
a collection of manuals for EVERY RADIO EVERY MADE IN THE WORLD. Not really,
but he will certainly have a SB-401 manual. He sells photoopies of manuals.
For the Heath equipment, he will send a complete manual with all the
construction steps, or a short version with just the alignment and operting
portion of the manual plus the schematic.

Here is another ham's opinion on HF antenna tuners. First, do not mess around
with a small tuner. You will only want a bigger one later on when yu try to
crank a linear thru a 300-watt tuner.

I have an MFJ 989C but I will never buy another piece of MFJ eqpt. When the tuner arrived, it was trashed. The bolts holding the roller inductor to the chassis were loose and the roller rattled around in the case. Several wires were not soldered and the knobs were misaligned with the shafts on the tunig capacitors. I simply took the thing apart and rebuilt it. Now, it works fine and I love it. I run full limit through it to tri-bander and to a 135-foot wire fed with 450-ohm ladder line. It is particularly good on the ladder ine dipole.
I recommend you STAY AWAY from the MFJ tuners. You just do not know what is going to come out of the box. Shop the ads in the ham mags and buy one of the expensive tuners, built like a battleship. The MURCH tuner is solid and had a great reputation. Or, shop around, buy the parts and build your own.
Remember, though, go for the big ones -- with high SWR, etc, you don't need small capacitors that arc.

73, Joe, K4FPT.

6089. Antennas for sale

Please advise via e-mail if you have any need for used and/or new commercial antennas.

We have a great deal of 900 mHz, some 450-470, some 150-170 in various configurations and conditions.

They are too numerous to detail: please advise of your frequency range, directionality, and gain required and I will let you know what is available and at what price.

Miles of Heliax cable as well.....most (almost all) has been never used, and consists of 'tails' of installations.

Prices: 1/2" is $1/ft, 7/8" is $2.50; you pay freight. Connectors are not included, but we will sell them to you at warehouse wholesale cost.

This cable is in new condition, and we have lengths up to 1000'.

> What is the model of the ICOM 6 mtr. all-mode rig...seems like
>551 is right but can't find anyone around here that knows...any help would
>be appreciated.

> tnx...cleve WD5BOR

ic 551a is the low power version with power supply built in. fm was
standard I believe. ic 551d is the high power model w/o power supply and
the fm board was an option. fm boards for 551a and 551d are different.

anybody have a fm board for a 551d they want to sell??

Ne> Hi all,
Ne> I'm soon going to join the Ham community. However, for the
Ne> moment, most of my operation, due to scheduling problems (I'm a full
Ne> time college student & I work 30-35 hrs/wk.), will be 2 meters mobile
Ne> and 'pedestrian mobile'. Therefore, I would like to purchase a HT. But,
Ne> since there is such a wide variety of rigs out there, I need some help.
Ne> The rig I'm looking for needs to at least meet these specs:
Ne> 1. PL encode (most all the machines around here use it.)
Ne> 2. DTMF keypad
Ne> 3. Connections for speaker-microphone
Ne> 4. At least 5 W RF output
Ne> 5. Price between $250-$275 (all I can afford.)
Ne>
Ne> If anyone knows of rigs that meet these specifications, please
Ne> post or email your experiences with them. Are they easy to use?
Ne> Reliable? Durable? I'm currently leaning
Ne> toward the RS HTX-202. Any comments about that one?
Ne>
Ne> 73's/Thanks
Ne>
Ne> Jim

Hi, Jim. Every new HT meets your specs except price. The HTX202 and the Alinco DJ-180 and F1T are the only "name brand" HTs that meet the price. You'll probably want an extra battery, maybe a speaker-mic and a magnet-mount antenna, and that would put the F1T over the limit. You won't want to use the "rubber duck" inside a car -- it won't work very well.

The HTX202 has had quality problems. Many people get a good one and are happy, but a noticable number of folks get lemmons that go back for repair or replacement. If you go that route, and something about the radio doesn't work right, beat on Radio Shack for a quick replacement (maybe cut a deal with the store before you buy).

The radio is frequently on sale near or below $200, so don't pay "regular price."

The DJ-180 is a little smaller, and not nearly as popular, but is probably a good radio. If I recall correctly, it does NOT have a connection for external DC power, so you're on battery all the time. Check that out before you buy -- you'll chew up batteries in a hurry at 5 watts.

The DJ-180 is probably a little easier to use at first... but that means fewer features you can program. After you learn the radio better, it's all "easy to use," and you'll appreciate the extra features. For example,

the HTX-202 has touch-tone "paging." You set a code in the radio, and it stays quiet until someone sends you your code with touch-tones.

I don't think either radio is supplied with a 12 volt battery -- you'll need that for 5-watt output. But you'll get more hours-per-day from the lower voltage / higher capacity batteries, and probably do fine with two or three watts output.

Good luck, 73

Well, the only way a maxtrac can be programmed into the ham band is with something called "lab" software that is used in the Motorola labs to develop hardware and software for the radios. That software SHOULD not be available outside of the lab to anyone ever. The standard software you can license from Mot does not have that feature.

>

i had a similar problem, and the phone call to bird was wasted. they said
they would not repair it, or sell me replacement parts. buy a new one,
please, and thanks for the call. so, i bit the bullet and tore the slug
apart and found an extremely thin metal shaving (visible under a magnifying
glass, but not to the unaided human eye) which had decided to short
across the diode. removal of said short brought the slug back to life.
slight damage to the front label plate is the only reminder of this
problem. to bird's credit, when i called them back with this info, they
sent me a small exterior part i hacked up (and didn't need to), but would
not send a new label plate for some reason. i still think they are a fine
company. YMMV, 73.

Date: 1994-11-28 14:46:26 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <CzzFpE.3sI@murdoch.acc.Virginia.EDU>
Source record: 222419

This may belong under "digital" but seems more appropriate here, since it is "equipment."

I'm looking for a good Windows-based QSO logging program that will interface with a Buckmaster CD-rom database. It should have all the "lookup" and QSL printing features, but it does not have to tune my radios. I kind of like to do that myself!

I know there are some rather expensive "automated shack" programs that will tune, move beams, etc., but that's more than I'm looking for. I do want the CD-rom database lookup feature, though.

Any advice, experiences, etc appreciated.

Please E-mail direct to:
sem2r@galen.med.virginia.edu

Thanks !! Stacey / WB4QKT

When I was working my way through colege in a MSS a FTR from Motorola showed us a trick that worked on SW released four years ago for the RIB and M-100 Maxtrak M-400 etc. radios. It goes like this:

When entering the frequencies into the software enter them with THE SHIFT KEY PRESSED. For example 146.850 would be !$^.*%). Note that the . is left as a ". The only problems we ran into is that on some bands the power control logic would not be able to handle the frquencies and the radio would put out full power. We had M-400's on 52.525 and 29.6000 and all our M216s that the shop used had 446.000 and 445.850 (?) in them. The W2RGI N.E.D.A node at OTSEGO user port is running a M-100. Please send me a reply if this works out.

6098. ### Request for advice in getting a HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-28 15:37:00 UTC
From: s2202629@np.ac.sg
Message-ID: <3bctes$b0q@nova.np.ac.sg>
Source record: 222437

This is definately a newbie question, one way or another, but here I go...

I plan to get a HT (2m?) at one point or another in my life (?) - and I'd like advice on what points/features should I pay attention to when I decide to sit down and look for one.

What features do you find most useful/essential for a HT? It can be anything as trival as a comfortable hold/PTT, to a backlit LCD display, ruggedness, etc.

What features do you find 'nice' to have, but you won't be missing much without it - especially when cost is a factor.

Finally, what features do you find totally crappy, and you'd a) rather do without, or b) you've never made use of it before, and probably never will - so much so, if I see this feature in a brochure, I can just ignore it totally...

I'm not looking for "XYZ HT is good, I've had one for {period of time}, and have had {unaccountable number} of {drastic thing that should not be done to a HT}, and it still works well - Get it." Although I won't mind if you do send them in.

Rather, I'd like something along the lines of "{feature} is something you should look out for" or "XYZ HT has {feature} which I find useful/useless".

(eg: A HT that has been designed not to receive out of band (and probably can't be mod'ed to do so), will (probably?) have a much better receiver) [Please don't flame me if this is wrong...]

I'd prefer replies via email, then I can try compile this together, and repost it on the net (eventually), and finally make a choice of what HT I can consider getting.

Rgds!

Cross-posted to: rec.radio.amateur.misc,rec.radio.swap,rec.radio.amateur.equipment,rec.antiques.radio+phono,rec.radio.shortwave,rec.radio.amateur.homebrew

I am getting back on the air after many years. I have a
Drake T4XB transmitter and Hammarlund HQ170AC-VHF receiver
that I had bought in the sixties. It is clear to me that
the Hammarlund has got to go. The question is:

1. Is it worth getting a used Drake R4B receiver from somewhere
or is equipment so much better these days that it is not
worth bothering?
2. What is the going rate to buy an R4B and where would
I get one?
3. What would the going rates be to sell the T4XB or HQ170
and where would I sell them? Are they collectors' items?
4. How have xmtrs & rcvrs improved in the last 25 years?
Sensitivity, selectivity, stability, features, programmability?

Note: I started when I was 9 yrs old so I am not as old as
this msg makes me seem.

Thanks,
Joe

Deletia

I have been running a KW TH78A in my 4-runner (86 model) for about 6 months now. I have XMitted from the rubber duckie inside the truck, as well as running a dual band mag mount on the
roof. I have had no problems other than the HT getting trashed bouncing around in the floor.
The engine control computer on my 4-runner is located in the passenger footwell behind the right kickpanel. I have never had any problem from interference etc. I am now running a KW TM733A at 50 watts on VHF and 35 watts on UHF with no problems.

If you really wanna go cheapie, you can get a BNC connection extension from MFJ which will allow you to mount the rubber duckie antenna on a small clip with about 2 feet of coax. I
have used this rig with the 78A in my wifes VW, and it works quite well. The clip is strong enough to hold on the raingutter at highway speeds, and the roof provides a pretty good ground plane. Reception and xmit is _much_ better than the HT/rubber duckie inside the car.

Enjoy!

Sorry, the bench guy was doing the adjustment and I was just holding antennas - parts etc and being a general gopher while kinda looking over his shoulder, and it was a year ago. I don't really know the answer to your question and I doubt that I could even do it again myself. Perhaps the schematic included with the manual would be of some assistance (but I don't think it helped any at the time.) The only reason I responded to the thread was that if you concentrate on deviation (like I did at first) you might not solve your problem.

73's and I hope someone else can jump in here with some experience

: wonderful radio and has a great receiver in it.

: I have noticed that our budget radio, the HTX-202 has, only at times, an
: extremely low deviation.

: I find this annoying when talking to more than one station in a group and
: I constanly have to turn up my volume to hear the person with the 202 but
: have to turn down my volume so I don't get hearing damage from the
: others. I am not the only one who has expressed this concern.

Dave: the earliest HTX 202 had this problem. THere are two
adjustments inside. One is audio deviation and the other is
tone deviation for the touch tone pad, RS had one set too
high (tones) and the other set too low. It should be safe
to adjust the deviation control for the mike audio while
someone is listening to make sure you don't go too far
and overdeviate. That's how I did my Heathkit transmitter
when I built it. You will have to figure out from the
schematic in the manual which one to adjust.
The problem with the tone deviation set too high is that
repeaters will reject the tones when you try to use them
for autopatch.

From: rfm@urth.eng.sun.com
Message-ID: <RFM.94Nov28122902@urth.eng.sun.com>
Source record: 222431

While putting an accessory in my shiny new Yaesu FT-736R, I misread the instructions and, instead of loosening the screws that hold the whole front panel assembly to the rest of the radio, I removed the screws that hold just the plastic front panel bezel to the rest of the front panel. Before I realized my mistake, a couple of the buttons that were held in by the bezel had popped out. Now, this shouldn't really be a problem to fix, just take the bezel off, put all the buttons back in, and put the bezel back on, being sure that everything fits into place. The trouble is, the bezel won't come off until all the knobs are removed, and I don't see how to get the main tuning knob off. The other knobs are no problem, they either pull off or have an obvious setscrew to loosen. But for the main tuning knob, there's no visible setscrew, and pulling with what seems to me to be a reasonable amount of force to remove a friction-fit knob seems to do nothing. Is there a secret way? Do I just need to apply more force to pull it off? If so, any ideas for applying said force without cracking or scratching up the front panel?

Jeff: Don't do it!
I believe there is a control in the rig that lets you set the
pwr level maximum. I think I get close to 120 watts out at
the factory setting. You can push it up but it's dangerous.
In SSB you can get away with it, but in other modes you will
fry your final amp.

[Article crossposted from comp.sys.ibm.pc.hardware.misc]
[Author was Ron Gross]
[Posted on Sun, 20 Nov 1994 18:36:12 GMT]

I need an upgraded version of EPW, the EPROM Writer program that came with my EPROM programmer. It is the type with adapter card and outboard ZIF with dip selection of EPROM type, up to 27256. The problem is that the program, version 1.0, doesn't support the 27256, only up to 27128. Is there a version of this that might work with this *generic* imported type of EPROM programmer (its pretty old by present standards, is 8 bit, and only likes to work in my antique XT clone, but nevertheless it WORKS!). Thanks to anyone who may be able to help...

From: bryanz@newmotpr
Message-ID: <D0029x.8FG@pts.mot.com>
Source record: 222439

Hi guys!!!;

I got a hanheld from bendix, it's a Bendix King.
After a few minutes with it I could program it to the ham frequencies
(It works
the VHF range). I Also did the programing to transmit, code and decode CTSS
tones.
I know from the programing display, that it has a lot of programing modes. It
can even be set to a transmit time-out time, etc.
I haven't been able to put it to transmit DTMF tones or to scan.
Does anyone know anything about it?
Is there a place that I can get the manual ??

Thanks...

From: "Colin Schmutter"
Message-ID: <3bdpll$spi@chopin.bcit.bc.ca>
Source record: 222438

I am restoring a Hammarlund SP 600 receiver. The unit works very well except that VFO drifts slightly with changes in filament and B+ voltages due to AC line voltage fluctuations.

Does anyone have advice as how to regulate the AC line voltage.

A simpler solution would be preferable.

Any replies would be appreciated.

Thanks

I've only experienced intermod once on my Icom IC-2410H dual
bander over the past 14 months of use. It's modified to permit
out of band reception up to about 900 MHz.

I chose the IC-2410H after hearing a lot of intermod on
a Yaesu FT-5200 in use at a nearby club station.

>as the back panel was removed or was it on the other (component)
>side?

I just bought a used HTX202 for my wife (she got her ticket last week). The transmit audio on this HT was also low; about 1/2 what it should have been. I looked at the schematic (2nd page of schematic, upper left) and decided that RV1 (22k) was the mic gain. I don't remember *exactly* where it was, but looking at the rear of the front panel, it was just to the right (and against) a shield near the bottom of the radio. The "RV1" marking was plainly visible beside the pot. CCW rotation increases gain. Worked for me...

Im curious to ease of use, memories, etc.. saw the review of the AZDEN and it sounded horrible as far as user friendliness...
Does the Alinco have built in CTSS? Do the memories remember tone/offset (it does support repeaters doesn't it?), display
brightness etc...

I'd love a 6m mobile rig, but prior to this one they seemed not to have all the features I"m used to on my kenwood
and yaesu dual band 2/440 rigs..

So my questions are.. do you have to lug the manual around to program/use it? Does it have all the normal
bells and whistles that we are used to on 5100s or 731s?

Thanks.. dying to spend more money at Dayton next year!

The rubber surface around the circumference of the main tuning knob
slips off revealing the set screws. Work it off slowly and silicone it to
put it back on.

There is a pot in the TS-850 that you can adjust to get more power output.
Be careful though, you run the risk of destroying the final transistors
and/or other related circuitry in the PA. Also, I wonder how "linear" the
final PA is after this bit of tweaking?? Better know what you are doing.
It is not as simple as turning a pot while watching the wattmeter go up.

Let us know what you find!!

Try IC-575 (/A or /H depending on built-in psu vs. hi-power.) as the more
current version. I think it does 10m also.

I have the 275H, 475H and 1275A already and I was thinking about getting
a 575 just a couple of days ago but then I located a clean R9000, so any
575 will be staying off the list for a while longer!!

Unless someone wants to make me an offer???

Our group's focus is on home entertainment items---acoustic phonos and
old radios, primarily from the 1920-50 period. While there is some
discussion of tube-type "boatanchor" communications radios, it is
generally of older general-coverage sets. The mail list
boatanchors@gnu.ai.mit.edu is a good place to get information on things
like HQ-170's and old transmitters.
>
>1. Is it worth getting a used Drake R4B receiver from somewhere
> or is equipment so much better these days that it is not
>worth bothering?
Most of us would rather have a Philco chairside, an old Atwater Kent,
or a Hallicraftrs SX-17. I've got a postwar Magnavox, an HQ-150, and
an RME-45, all working fine, and wouldn't trade any of them for a Drake.
Can't get the French and Canadian (french) shortwave stations with a
Drake.

>2. What is the going rate to buy an R4B and where would
> I get one?
Not very likely here. A Drake is a ham receiver, not home
entertainment.

>3. What would the going rates be to sell the T4XB or HQ170
> and where would I sell them? Are they collectors' items?
Once again, this is not an amateur radio newsgroup.

>4. How have xmtrs & rcvrs improved in the last 25 years?
> Sensitivity, selectivity, stability, features, programmability?

Define "improved." A lot of our readers think that a Victor
Orthophonic is superior to an electric phonograph.
>

These questions are about getting active in ham radio, and there are newsgroups that are directed toward that purpose, which this item was posted to. It shouldn't have been crossposted here. This is an antiques group, created to take discussion of home entertainment stuff out of rec.antiques. There are several amateur radio groups, and we don't attempt to fill any gaps in them in this group---if, indeed, there are any.

Try the Smithsonian |-)
2~ Just kidding welcome back. About 15 years ago everything
changed to synthesised rigs. You can get a used one for quite cheap
from 10yrs ago that does 90% of what a new one does (IMHO). I was
out of it for 20yrs too. Things changed a lot in the 70;s.

6134. Replacing diodes in Drake W4

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-29 16:39:17 UTC
From: dgf@netcom.com
Message-ID: <dgfD01FLH.2Cw@netcom.com>
Source record: 222358

My drake W4 wattmeter lost it's diodes in some rain static buildup last year. When I replaced the diodes with a couple of generic germanium diodes the calibration changed considerably. I expected some change, but could not fully compensate with the four trimpots in the W4. Not having done this before (replacing diodes in a SWR bridge) I probably failed to choose the right diodes and/or match them.

Any advice?

In article <3bctes$b0q@nova.np.ac.sg>, s2202629@np.ac.sg (Teh Aik Wen) says:
>
>This is definately a newbie question, one way or another, but here I go...
>
>I plan to get a HT (2m?) at one point or another in my life (?) - and I'd
>like advice on what points/features should I pay attention to when I decide
>to sit down and look for one.
>
>What features do you find most useful/essential for a HT? It can be anything
>as trival as a comfortable hold/PTT, to a backlit LCD display, ruggedness,
>etc.
>

There is a feature on my HT that I find totally useless and I will never use: The ability to "clone" one radio into another. One feature that I wish my HT had: Ability to replace the internal RAM backup battery without sending it back to the factory. Feature that my HT has that I wish my mobile rig had: Ability to store alphanumeric memory title so that you can look, for instance, at "N4GKE" instead of the number or the memory location 11.

The best advice I can give to anyone considering purchase of an HT (or any other complex programmable device) is to get your hands on a copy of the manual for every item you are considering purchasing and look it over thoroughly. This is what I have done in the past, and it has really been an eye opener.

Hello!

I am interested in collecting opinions on the ICOM R-100 receiver.

I will be using it across its full coverage range, both AM and FM.

I am interested in hearing your experiences, good or bad.

Thank you and 73!

Ron (wb8ruq).

6137. Standard C5718 Dual Band Modile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-29 18:57:42 UTC
From: dep@scr.siemens.com
Message-ID: <D01M06.4FH@scr.siemens.com>
Source record: 222360

Hi

I am thinking about buying a Standard 2M/440 dual band mobile.
Does anybody have any experiance with this radio?

When I first saw it I didn't like having all the controls
in the mic. The more I though about it the more I like it.

The add says it is packet ready and will do 1200/2400 and 9600
baud packet, anybody have any comments on this?

I have read the mod files on the Standard dual ban HTs 528/558.
Is the c5718 similar?

Thanks for any help

I've used 1N5711 or the HP5082-2800 in a number of different wattmeters, and
experienced no difficulties. I picked the lowest Vf of the batch and tried to
find two alike.

Subject: Conversion of Uniden CB to 10 meters
Newsgroups: rec.radio.amateur.equipment
Organization: Tyrell Corporation - 800-TYRELL-1 - POP's in 504/816/913
Summary:
Keywords:

With the kind assistance of several other hams, I have made a partial conversion of a "President Model Washington" SSB CB rig to 10 meters. The PLL fundamental crystal frequency was increased from 11.225 to 11.535 MHZ and the RIT circuit modified to allow shifting of both transmit and receive.

The radio now covers from 28.220 to 28.660 MHZ in 40 steps and can be additionally shifted +/- 3KHZ from each center frequency. In order to complete the mod, I would like to remove or replace the voltage limiting resistor that inhibits the varactor from providing a greater shift.

I have had no success in getting the proper schematic for this rig. It uses a MB8719 PLL chip and was manufactured during the early to mid 1980's. Does anyone have any idea what resistor should be bypassed or another method to achieve the shift?

All replies are appreciated... de Karl - KD5LR

Bruce,

Why are you selling you FT-530? I was thinking about buying one. It seems
to have all the features anyone could want.

Are you unhappy with the unit? Are there performance issues or features
you wanted that the FT-530 did not have? Pray tell!

6144. 45' PORTABLE MIL SPEC CRANK UP TOWER!!! FS

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-29 21:03:11 UTC
From: sidener@crunch.nuc.umr.edu
Message-ID: <3bg4uf$kkb@hptemp1.cc.umr.edu>
Source record: 222366

I have a 45 ft. portable crank-up tower for sale.

It is identical to the ones used in Desert Storm for microwave links.

It is made of aluminum except for the steel bolts.

It consists of a base and eight sections of <<heavy duty>> 6 inch diameter aluminum tubes which lock together.

The overall dimensions are: 1.5' x 2' x 7' Weight: 250 lbs.

The tower sections are not tapered! They remain a constant 6 inch diameter all the way to the top!

The tubes are housed in a cage which is clipped to the base unit.
This cage has two handles so the two men can easily carry the whole structure.

There is a nose cone included which will accept a 1 1/2 inch mast at the top by inserting two 3/8 inch pins.

There is a guy wire ring that mounts on the nose cone that is on bearings.

There is also another guy wire ring which can be put on any of the poles along the way up!

To operate you simply remove the cage containing the tubes and stand up the base. After the base has been secured (3/4 inch bolts or very large stakes) you just insert the first pole put the nose cone on top and crank up. Then you lock the break which holds that pole and shove in the next pole and lock it into the first one. You then run that pole on up and lock in the next and continue on until you are done.

You can leave the break on for a rigid mast or you can release it and rotate the whole mast with your hands (or a rotor) The base has 1/2 degree markings for rotation. You don't have to worry about the guy wires because they spin around the mast.

!!!!! This tower is wonderfull !!! I have one installed myself (permanently) but I have come across one extra to sell!

It is perfect fro throwing into your pickup and running off to field day operations, or just set it up at home. Once it is in place it is truely a one man operation!!

I am asking $400.00 You must supply the shipping or pick up from central Missouri.

Let me know if you are interested or want more info.

Thanks, Scott Sidener N0WFL sidener@umr.edu

Yes. A larger quantity of early HTX 202's had low modulation. R.S. fixed
or replaced any that was returned.
There has been less of them lately. Unfortunatly several of the early
ones got into the used market unfixed. Now the poor soul will have to pay
or fix it themselves.

I think that this is unduly pessimistic advice. I use indoor antennas exclusively, and have 194 contacts out of the 250 required for five-band Worked All States. And I have every state but Hawaii on 75 meter phone. I got Alaska on a pair of 75 meter hamsticks, fed as a dipole and hanging from the archway between my dining room and living room. Was I lucky? Obviously, but don't say it can't be done.

Indoor antennas are obviously a handicap, but not an insuperable one. The advice this guy needs is to persevere, not to give up. The secret is to listen, listen, listen and to make hay when conditions are optimal.

HI ALL,

I have purchased two UHF trcvr "Telereader DTR-192" (TASCO,Japan)
with int. TNC contr. (max speed 19200 in GMSK mode).
So, I try it but have a bad result with 19200 GMSK MODE, because
CPS was not more than 50!
Well, my tel. modem ZyXEL have on this speed 1800-2000cps,
I understand that, "this is RADIO", but 50cps... :-(

Does anyone have any recommendations about this RIG ?
Or maybe have experience with HIGH-SPEED radio-modem.
Advice and ideas welcomed.

6161. OMNI VI upgrade & recent QST articles

Date: 1994-11-30 14:29:49 UTC
From: mosier@fagan.uncg.edu
Message-ID: <mosier.305.0@fagan.uncg.edu>
Source record: 222382

Ten-Tec just sent a 2-resistor-mod out to all owners and referenced the recent series of QST articles on receiver performance. QST talked about 2nd and 3rd order intercepts and ham vs. military receiver performance, the jist of the article being to replace your filter-bank diode switches with RF PIN diodes. The Ten-Tec OMNI VI 3rd order IMD performance was about the worst. Then Ten-Tec shows up with a mod involving a two-resistor board mod which would raise the performance to current standards without the PIN diode change. In fact, QST acknowledged that mod in the most recent article (Dec. issue) and said that the PIN diode changeout didn't make sense with that kind of performance improvement.

BUT... Ten-Tec also said in their mailing to owners that if you lived in North America, the resistor mod didn't make much sense. Do it if you really want to, but you won't notice any change unless you're in the high power SW broadcast intermod environment of Europe.

SO: if Ten-Tec is right and there is no need to upgrade (in the U.S.) the WORST 3rd order IMD performance among current high-end ham receivers, why the QST article hoopla? Is the performance a necessity or just a desire to have state-of-the-art performance <in case>?

And, lastly, has anyone made the Ten-Tec mods?

A friend of mine,working in an isolated village in northern Alaska,has found a radio and wants to know what he has.Its a Northern Radio Co.Seattle WA Model N550.Thats all I know.He is working on his ham license now and should soon have Tec plus licensure.Will this thing do him any good??Please post or e-mail any info. to me and I'll pass it on.Thanks now for your help.
Bill KJ5CI E-mail schiller@cherokee.nsuok.edu

6163. OMNI VI upgrade/2nd order IMD

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-30 16:16:25 UTC
From: ham@wam.umd.edu
Message-ID: <3bi8gp$kvd@cville-srv.wam.umd.edu>
Source record: 222385

The 3rd-order products weren't the issue here. It was that the 2nd-order products were supposed to be +60 dbm, and the radio only measured to +40 dbm. The resistor mods were said to take care of this discrepancy.

The QST article acknowledged that these resistor mods would make the PIN diode changeover unnecessary.

Apparently the differences between the OMNI V and VI are significant enough that the OMNI V wasn't affected by the 2nd order IMD problem.

6164. The secret life of the TH79E

Newsgroup: rec.radio.amateur.equipment
Date: 1994-11-30 17:02:52 UTC
From: bryant@janus.dec.com
Message-ID: <3bibor$93s@nntpd.lkg.dec.com>
Source record: 222386

In an advertisment for the TH79A, Lowe Elecronics, a UK dealer states:

"Many of the features of the TH79E are hidden away, not even revealed in the manual.....<invitation to purchase the transceiver>....absolutely free of charge our wonderful booklet "The secret life of the TH79E", detailing all the modifications and hidden functions hidden in this marvellous little transceiver"

I have seen the modification details published here showing how to get wideband transmit and receive. Is this what they are refering to, or is there more?

A mod that I would be particularly interested in is on that gets it to operate on 70MHz, the UK 4 meter band.

Joe, I think that the T4XB is a good transmitter. I have a Drake
T4XC and R4C receiver that I picked up about a year ago. I have
some newer stuff such as a Kenwood TS-940, but the Drake C line
gets great reports and has lots of power. The short term frequency
stability after just turning on the C line is about 300 Hertz of
drift, but after that it settles down.

>Does anybody have any experiance with this radio?

I just got one.

>When I first saw it I didn't like having all the controls
>in the mic. The more I though about it the more I like it.

It's a neat idea. The biggest disadvantage is that *everything* is controlled with push buttons. To adjust the volume, for example, you have to push the volume button and then the up and down buttons -- a real pain. And if you wait too long to press the up and down buttons, the volume function times out and you'll be changing the frequency instead.

Even for functions you'd normally use push buttons for, I have to say this radio has one of the worst user interfaces I've ever used. There are a whole bunch of functions I can't seem to remember how to perform no matter how many times I read the manual (which isn't every good either), because they just don't seem to make sense. In fact, it seems like some of the descriptions in the manual are just plain wrong (one example is scanning between two user-specified frequencies).

>The add says it is packet ready and will do 1200/2400 and 9600
>baud packet, anybody have any comments on this?

There's a DIN connector on the back for 9600 bps packet (actually a little stub cable with a connector at the end. The radio is so small there isn't room for all the connectors on the back, so the antenna, packet, and power connectors are all at the end of little stub cables). The recommended Tx delay is 30ms, which seems pretty acceptable. I got a KPC9612 to go with it and I built the cable to connect them, but I haven't connected to anyone yet (does anyone know any 9600 packet BBSs in the Seattle, WA area?) so I don't know if it's even working or what adjustments I need to make to the TNC, if any.

>I have read the mod files on the Standard dual ban HTs 528/558.
>Is the c5718 similar?

I'm not sure.

Hope this helps,

Yes, I have used one quite successfully for 9600 baud and 1200 baud
operation. Very convenient all-in-one solution. Do you have similar
problems when using it at lower speeds?

(And remember, given the half-duplex, packetized nature of typical
terrestrial packet, you will not see the same throughput as a
telephone modem that never has to wait for a transmitter to key. :-)

I got a Kenwood TH-78A in April of 94' and I did alot of talking on it . It
burnt out 4 weeks ago and I sent it to kenwood and they whent that nice
I told them cross band repeat was not working and they said it had
to be enabled by removing a diode and I said well I am sending my
radio in to be fixed could you remove the diode and they said yes
but they would have to charge me $20.00 and I told them when
i paid $430.00 I was told among all the features it had cross
band repeat and I told them if they didn't do it for free i
would sue them for false advertisment so i raised
alot of hell and they did it for free !!!!

Hello folks,

I just purchased a brand new Icom IC-820H and I need to find out any hidden features that you might be aware off.

Until now, I managed to find out how to make it an FM-FM repeater, but I would like to know more (like for example how can the repeater's tail be reduced, it sounds quite long to me) etc.

If someone has any additional info, I would very much appreciate if you could forward it to my reply-to address, as I am not receiving the list here, due to heavy charges by our Internet provider.

Many thanks for your time and effort.

-->
-->Mark, KC7FAA
-->

One of the nicest features of the FT530 is the voltmeter
readout. Lets you know the battery voltage so you know
about when you are going to need a new one. Also, if you
believe the NiCad memory effect story, you can be sure it
is fully drained before recharging.

Unless of course you happen to have one of those nifty
looking Power Checkers described in the New Products
Section of this month's (DEC) 73 magazine. It is a
little cylindrical tube with LEDs inside that attaches
to the HT. (It has a BNC connector and is about 4"high
and 1/2 diameter) LEDs illuminate to readout the RF
power applied to the device. .3w, .6w, 1.0w, ...,10w.

I would like to purchase or maybe build a QRP rig this winter. Where do
I go to find some information about QRP rigs other than looking at adds
in the usual hobby magazines?

Source record: 222319

The Standard C288
is a really good 220 singleband HT. Features Iespecially liked
included the excellent receiver. It covers down to about 110 MHZ with
sensitivity equal to a regular 2 meter rig. At the 220 frequency, the
receiver is unsurpassed among handhelds in my opinion. The rig runs
cool, even at the 5 watt level. Programming is easy.
Major complaint for me is that you must purchase an adapter to
run the radio from 12V. There is no direct plug...must remove battery
and add the adapter.
I am a big standard fan, and this radio is no exception to the
general rule that they build excellent equipment. Reports of transmitt
audio, unsolicited, were uniformly very positive.

I also drive a 94 4-runner and I run 144/220/440 and HF from the
car regularly. I have no problem on any band. Maximum power I run on
VHF/UHF is 50 watts, although I usually keep it lower than that. Your
HT should work just fine.
Enjoy the radio, welcome to the ranks of amateur radio. 73 Dave

6194. Drake MN-2000/7000 tuner ??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-02 03:46:25 UTC
From: tjb9c@galen.med.Virginia.EDU
Message-ID: <D05ztE.2wp@murdoch.acc.Virginia.EDU>
Source record: 222317

After 4 years, my MFJ 949D tuner gave up the ghost and I am looking for another tuner. I purchased a MFJ 986 tuner and it was completely non functional out of the box,so I sent it back. Having had other bad experiences with MFJ quality control, I am looking at other sources of tuners.
I live in a restricted subdivision (more like a prison!) and run barefoot into a G5RV hidden in the trees. I am wondering if anyone could give me any info regarding their opinions on the old Drake MN2000/7000 tuners. I know nothing about them (only been ham 4 yrs) but was told they're built like battleships. I don't care if the tuner is big or ugly, I just want to find a tuner with a proven track record that is built to last.
Any info on these or other tuners from some of you veteran hams would be most appreciated. Thanks & 73.

> locally.

For those that did get an extended warranty on the 202's, you need to look at the back of your HT and find the serial number. If it is a very low SN, 1000 or below, you should take it to the nearest RS and have them change the boards out. There was indeed difficulty with those first few manufactured, but they have rectified the situation (about 20 months ago).

Message-ID: <3bo19f$hq2@worf.qntm.com>
Source record: 222325

Hi all! I'm pretty new to Amateur radio, and know nothing about Packet radio (yet). I have a fairly immediate need to purchase a modem for conventional telephone line usage, and hope to soon use packet radio. So, my question is, can a packet TNC serve both functions? That is, can I use a TNC for both radio and telephone line communication?

If the answer to the above question is yes, what would be considered essential features of a TNC?

Thanks,
Dave Foster (KE6MOM)

I've never heard of an MN7000. Perhaps you mean the MN2700? That was the one that went with the 7-line (TR7 etc.). The MN2000 went with the 4-line (TR4, T4X, R4). The low-power (150W) versions are the MN-7 and MN-4, respectively.

The MN2700 is basically the same as a repackaged MN2000 except it has the 160 meter band added. They both are very nice tuners. (The fact I designed the MN2700 has nothing to do with that opinion! :-)

They have a built-in SWR meter and antenna switch which helps reduce the wiring rats nest in the shack. They are conservatively rated and have a max insertion loss spec (0.5 dB as I recall) which is very rare among amateur tuners. They are easier to tune up than most tuners and have good harmonic rejection due to the PI-L network employed. The disadvantage of the PI-L is a relatively restricted tuning range: The spec says 5:1 SWR at any phase angle, although they will do much better than that at phase angles around 0 degrees (high-impedance antenna load.)

In clearing out my Grandfather's house (he became a silent key before I was born, but my uncle was living there), I came across all of his old equipment. I am looking for any information at all about this equipment: Schematics, Manuals, Service Advice, even stories about chasing DX. Here is the equipment:

Elmac AF67 Mobile Transmitter
Elmac 110V AC Power Supply for AF67
Morrow 5BR-1 Mobile Receiver
Swan SS200 SSB Transmitter
Swan PS20 Power Suppy for SS200

The Swan works, but I don't know about anything else. Also, if anyone has any companion pieces to any of the above equipment, I would be interested in purchasing/swapping. The Elmac was my father's, and I would love to give him the companion receiver (if there was one) for Christmas. Please let me know. Any information would be appreciated.

JOE: You probably want a serious reply to your question, not just a lot of
FLABS (Folklore and B___ S___). But, it's the end of a long week and I've been

adjustingmy attitude with 12-year-old single malt Scotch, so here goes. Do not dump those two old classics. I was licensed in 1958 and will be 50 years old next week. I drive a 72 VW Beetle, write with a Parker 51 fountain pen given to me by my grandfather when I entered high school, and cut my grass with a push mower. Keep the old stuff. Clean it up. Get some tuner cleaner at RAdio Shack and blast all the variable capacitors and potentiometers'; that will clean out a lot of the problems. Replace the fileter capacitors. Make a list of the tube types and whenvever you encounter tubes for sale, buy some. Of course, you probably ought ot go ahead and buy yourself a recent model rice box from ICOM (I use the IC-129; the IC-735 is a classic), Kenwood, or Yaesu and get on the air. But, keep the old stuff. Make yur ice cream in a hand-cranked freezer. Drink our beer from the bottle. Be eccentric. You only live once and it's your life.

STEVE: The top-of-the-line headset-mikes generally available on the amateur
market are the Heil headset-mikes. But, they cost a good bit more than the
Radio Shack $55. The most expensive Heil has paded dual-earpiece headset with
a boom mike at $122. You can get down to the single small earphone with boom
mike for $65. Several other models between those two. Be careful. the Heil
mikes are engineered for excellent communications audio. The HC-4 peaks audio
response at 2000 hz, great for adding a little pucnh to the audio. The HC-5
mike peaks about 2100 -- a little smoother than the HC-4. But -- they are
low-impeadance, 600 ohm mikes without built-in pre-amps. They may not work on
yur rig. I had to return the one I bought because it would not provide
sufficient audio to drive my rig and Heil said the ony fix wa a modificatin to
the rig.

Now, Asden makes a boom mike-headset combo for $70.00. Mike is low impeadance (500 ohm) and does not have built-in preamp.

Good luck.

73, Joe.

6208. 2 Meter HT Advice Neede

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-03 16:21:00 UTC
From: clint.bradford@ectech.com
Message-ID: <9412031007001379@ectech.com>
Source record: 222337

1. PL encode (most all the machines around here use it.)
2. DTMF keypad
3. Connections for speaker-microphone
4. At least 5 W RF output
5. Price between $250-$275 (all I can afford.)

Join your local Amateur Radio club. Or two. Or three.

Buy a used unit from a fellow club member.

The HTX-202 is an EXCELLENT unit. It ain't pretty. It doesn't have 200 channels. But it is one of the solid-est performers out there - and it does what it professes to do excellently.

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel

(don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

Throw it in the freezer for a couple of hours, then take it out and
rap it against the countertop. The glue will break loose and you won't
have to mutilate it to get it apart. You shouldn't replace just one
cell in a pack though, you want to replace the entire group of cells
as a unit. Otherwise, the next weakest cell will fail and you'll have
to do the exercise all over again. Rebuild packs of cells are fairly
inexpensive, and available from several sources.

Date: 1994-12-03 21:25:18 UTC
From: daholt@k12.ucs.umass.edu
Message-ID: <1994Dec3.212518.1193@k12.ucs.umass.edu>
Source record: 222340

Hi!

A couple of friends of mine and I are considering purchasing the
ft900- anyone have any comments on operation of this rig? How
does it rate up to the ft890, and KENWOODS TS50?

What kind of antenna would be best for mobile hf operation?

Any news available on the outbacker???

Thanks and 73's

Dave-N10WC

Someone from Mexico wrote me and asked:

Subject: URGENT FROM MEXICO
To: daholt@k12.ucs.umass.edu

David A Holt:

We are a Mexican public radio group in the UNAM University, we read
your articles in the amateur radio newsgroup and we need your help. We
have a tranceptor YAESU FT 840 and we need information about it's CPU
because it can't transmit in AM commercial band, only above 1800 KHz;
and the most of people can receive us only in commercial band.
The tranceptor's CPU is a:

Q2009
HO8475348F10 HY-176
(HD 6435348F10)
CPU

In the AM - FILTER - UNIT (No.83XX) F3396000

If you can send us information about it and how to modify it
or do you know the YAESU e-mail or if you want more information about
our group please write to:

eduardoc@redvax1.dgsca.unam.mx
or
rgomez@redvax1.dgsca.unam.mx

Thanks and please write to us.bye.

If anyone has an answer for this, would you please write to
me or the addressees, thanks.

73's

Dave-N1OWC

Don't know how but they are "Hamtronics" and they are in Trevose, PA. Not the same companies. I don't know what to make of this. I have dealt with Hamtronics in Trevose and they seem to be a good bunch of guys. Of course I have not used their repair facility, just showroom sales. Their prices seem fair enough. They have a good reputation in the Philly area.

>Dave Foster (KE6MOM)
>dfoster@worf.qntm.com

NO! 1200 baud packet uses an obsolete standard no longer used for telephone purposes (surplus modems were cheap and plentiful at the time, I guess). 9600 baud packet is even further removed from the telephone variety.

A good beginner rig that is affordable is the Ten-Tec Scout. It cost less than $550 with 1 band module. The modules cost around $30 each now. I've had this rig for about a year and love it!!

It puts out 50w on CW & phone.

If you're looking for a good used rig there are several sources such as Ham Trader and local ham radio stores.

From: adrandy@aol.com
Message-ID: <3bshfr$16f@newsbf02.news.aol.com>
Source record: 222253

I'm still looking for old 50s and early 60s transistor radios. These are the small kind made of plastic (sometimes with metal trim) and were usually made in the US or Japan. Let me know what you have by emailing me information...the name and model number (if you know it), whether or not it works (hopefully but not required) and has the box (not necessary but adds to the value). If the radio is in poor physical shape, the value is much less from a collecting standpoint. I'll pay $10 to $40 for most radios, but a few radios may merit anywhere from $60-200 (Sony TR-55 and TR-63, Regency TR-1, Toshiba 5TR-193, for examples).

Keep me posted with asking price if possible; thanks again; and 73 de WA4FJF.

Randy
email: adrandy@aol.com

P.S. I'm also looking for 50s/60s radios marketed to children. They typically had only 2 transistors and worked marginally if at all. Plastic cases. They were sometimes marketed as "Boy's Radios" or "toy" radios, etc. Please email with what you've got.

I was just at a local flea market and picked up a General Electric HT, with battery, charger, and some sort of an adaptor... It's an MPI series, sticker on the back has a couple numbers.. TR-102, and 101211303. It is crystal controlled, set up for 468.xxx Mhz..

What I would like to do is modify it for use in the 440 mhz band.. Seeing as there are only 2 repeaters in my area, ithe 2 channel limit won't cause any grief.. Does anyone have any info on these units, or any tips on modifying them? (BTW, this is my first shot at modifying equipment for use in ham radio)..

Thanks for any info..

Message-ID: <1994Dec4.202811.7387@k12.ucs.umass.edu>
Source record: 222257

I use my 5200 as my mobile and base rig, moving it from the car to the shack. A bit tedious but it beats freezing my rear in the mobile ham shack in the driveway!

I am curious to know if there is a base mike that is (or could be made to be)compatible with the 5200. Is there a chip to extend the memory from 13 per band to ???

Also I use a Astron RS12 to power it. Good for low power (5Watts) but running 50 Watts pushes the power supply into the intermittent cycle range. Any suggestions for a reliable power supply with enough continuous amps to handle the 5200?

Thanks for your time

Source record: 222262

Hi Ken:
Well I never had a PCS-7300H but I have had 3 AZDENS and I hope to never own another..... The PCS 3000 seems to be a workhorse. I've had one running on packet for 6 years without a hitch. I bought a PCS 4000 and a PCS 5000 and found them to be very very unreliable for mobile use. The local oscillator section (in a metal can sealed with wax) fails regularly. You can take it apart and clean out the wax using a heat lamp-pick and scratch- paick & scratch and then resolder and it works for 5-6 months and then does the PLL lock-up thing again. I don't know if the 7300 takes after any of these 2 meter models or not, but I would not want to recommend any AZDEN to you. Again the PCS-3000 has done well for me (which is why I bought the others- but they were miserable radios).
Sorry to be the "party-pooper" Joe- N4NAS in KY

>An article by Kenwood on this newsgroup mentioned clone but gave
>no explanation for it. Does anyone know what clone means or does?
>My radio is totally non-functional while CLONE is on the display.

If it means the same thing as it does in the commercial two-way
equipment world, the purpose of the mode is to allow copying one radio's
operating parameters (frequencies, offsets, memory contents, etc) to
another radio - i.e. to "clone" one radio into another.

The actual connection might be a wierd cable from one or two
otherwise-unused mic jack pins, or perhaps even via a transmitted data
burst - I've never seen the radio, nor am I familiar with Kenwood HTs in
general - all of mine are Motorola except for one Yaesu.

Source record: 222260
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I also am using indoor antennas exclusively due to antenna restrictions i my neighborhood. I live in a ownhouse with aluminum siding which, you would think, would be a ham operaor's nightmare QTH. However, I routinely work DX with dipoles in my attic.

I have about 95 countries confirmed for my DXCC award and find it quite challenging to work on an "indoor" DXCC award. Of course, you have to LISTEN and be patient! But, with persistence, you too can break pileups!

I have received QSL cards from Ethiopia (ET), Norfolk Island VK9N in S. Pacific), Faeroe Is. (OY), Malawi (7Q7), Papua New Guiinea (PP29), Franz Josef Land (4K2), Nigeria (5N), Burkina Faso (XT), Kuwait (9K2), an numerous other DX stations around the world. I am living proof that working nice DX with indoor dipoles in your attic can be done.

I highly recommend working CW mainly (much more efficient than SSB) and listeninga lot. TrDo't get discouraged in a pileeup! I have broken through many timees aand it's quite satisfying to know you werre able to "beat the odds"!

My rig is a Yaesu FT-990 running 100 watts.

Good luck and don't despair.Turn a negative into a positive--indoor antennas are a lot like working QRP in that you're doing more with less.

73,

Jack Jeffery, KB4CG

6238. Ham radio in automobile -- Damage to ECM?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-05 05:45:31 UTC
From: johnw267@aol.com
Message-ID: <3bu9dr$qmf@newsbf01.news.aol.com>
Source record: 222264

I've heard that the Electronic Control Modules in some cars can be damaged by Amateur radio RF. To my knowledge, is depends on various factors. What I'm curious about is if anyone knows if Chevrolet Berettas are vulnerable to this problem? I have one whose computer was recently replaced. Out of curiosity, I asked the Chevy mechanic if their cars could be damaged by amateur radio emissions; he assured me that it wasn't a problem. To make a long strory short, I started having trouble with the computer again just a few minutes after ending a QSO on 2 meters at 5 watts with an external 3/8 wave antenna. Coincidence? I don't know.

Anyone having any previous experience with such problems, please respond.

Looking for the above tube from an old RF generator. Part, or even info about a source of this would be appreciated. Many tube dealers don't have it...I've tried lots of hamfests..Please email me directly. Thanks..

Source record: 222267

I picked up a vertical 10-15-20 meter antenna from a friend. It is made by Mini Products Inc. of Erie, PA. They are no longer in business. The antenna is missing 3 of its brass rod radiators. They are 6" long and threaded at one end.

Does anyone know where I can get replacement radiators? There are 3 tiers of these radiators at both the bottom and the top of the unit, one pointing vertically and the bottom pointing horizontally.

Any suggestions?

Greetings. The Kenwood TM-733A comes ready from the factory ready to
do cross-band repeating. I've included the "undocumented" FAQ sheet for
the radio. Hope you find it useful.

By the way, this document is also available from anonymous ftp at
oak.oakland.edu as pub/hamradio/mods/kenwood/tm733.mod

Attachment:

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
Release 2.0 Updated October 1, 1994

Updates for Release 2.0 are identified by parenthetical statements.
There is also some new information sprinkled throughout the previous material
either to update it, to correct misinformation, or to be more specific.

This document is a compilation of Internet messages from
Steve Haehnichen KE6JGK and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Refer to diagram below. (Inserted into Release 2.0)

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio.
It will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

ONLY Removing Jumper 1 (B2) is the MARS/CAP modification.

** Diagram of specified area on Control Board **

EDGE OF BOARD, viewed from the rear, looking toward front panel

Green jumper wires (B2, B3)

The jumpers are actually soldered on the other side of the board,
but the loops come up over the top and hang over the B0/B1 side.

B0=R414
B1=R412

Here's something interesting! According the Kenwood rep I spoke to, performing this mod *does not* void your factory warranty. The same goes for any Kenwood published service bulletin or modification info. We are encouraged to perform the repairs ourselves to save them the trouble and expence.

DTMF Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented). The radio can also be externally DTMF controllable with an HT, but that will be described later.

The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is active all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

Note that the TM-733 can also be used as a "one-way" cross-band repeater. For example, if you can receive a distant repeater with your HT, but have difficulty getting into it, you can use the TM-733 to boost your transmitted signal. To set this up, just omit the part where you "change the control to the other band by pressing [CONT SEL]." Doing this will setup the TM-733 to repeat your signal to the other band, but will not retransmit the distant station back to you. If this sounds ambiguous, play around with it a little and it will begin to make sense.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

(Updated information for Release 2.0):

Per Ricardo, a Kenwood technician, they are aware of this bug and are working on a fix. No details yet.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of
memory channels available for each band. Example: You can not clone a
stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if
they seem identical.

Be careful when using the clone feature. It has been known to wipe out
or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known problem with the transmitted PL (CTCSS) tone.
The tones are filthy. They contain many harmonics and synthesis noise.
I'm guessing this is because they are using 7-bits from the CPU and a
resistor net (DAC) to synthesize the tone. The sound/intensity of the
noise depends on the actual frequency being generated. The PL tones also
come out of the radio's speaker while transmitting. Weird, but not a problem.

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the
noise beats with the tone. Go simplex and ask someone to describe the
noise to you, or listen carefully to your own speaker while
transmitting. Some repeaters do a better job than others of hiding
the noise for you.

(New information inserted into r2.0):

==========
Transmit PL Fix
==========

Kenwood just released a Service Bulletin to address the transmitted PL
tone noise on the TM-733A. (Yeah!!) Call the Kenwood Service
Dept. (1-310-639-7140) if you want a hardcopy. Here's a summary of
the text. Use it at your own risk. If you are going to get into your
radio with a hot iron, you should first get the real paper from
Kenwood with the drawing.

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high
level of distortion. This is easily seen when the incoming signal is
viewed on an oscilloscope.

Countermeasure:

Change the value of the "Pull-up" resistors in the PL tone encoder

circuit as shown in the accompanying chart and illustration. This reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k
R545	1.8k	6.8k
R546	1.8k	10k
R547	1.8k	10k
R548	1.8k	10k

Procedure:

1. Disconnect the power cable, microphone and antenna's, etc.
2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.
5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to the chassis.
8. Turn the circuit board over and replace the resistors using the parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View

Caution: This modification requires advanced surface mount soldering equipment that is rated for CMOS circuits. It also requires familiarity with advanced surface mount soldering techniques. If you

do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance from your closest Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The dirty PL is definitely found on early models, but we have had many reports that the PL problem has been fixed in newer versions of the radio. If you purchased your radio after September 15, 1994, (or your serial number is greater than 55000000) it's a good chance that you may not have the PL problem.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different than DTMF Remote Mode. This mode
concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio
back on, then release [CONT SEL]. The S-meter scale and the DT
indicators for the UHF band will begin flashing. The LOCK indicator
will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and
press the following key sequence: "Axxx#" where "xxx" is the preset
DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and
the DT indicator will stop flashing. The radio can now be
remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then
press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will
recognize this because of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place
the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating
as a frequency agile remote base. Now Kenwood just needs a CW IDer!

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT], [TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials shows the digitized level.

This looks useful for checking all the keys and dials when you suspect a bad connection.

----------snip here and print----------

Kenwood TM-733A Quick Reference Guide by Brad Killebrew N5LJV

[#] PRESS A NUMBER, NOT THE POUND SIGN.
[KEY] PRESS AND RELEASE [KEY]

The September Issue of QST had a long and informative article about this very
problem. I think it was Sep - the cover had a photo of several cars on it.
Automotive RFI was the lead story.

Not sure if this is the right place to ask, but:

When I turn on my old receiver, I get a large burst of static. I'm afraid I'll blow out a speaker.
What could be causing this, and how can I fix it?

If this is the wrong forum for my question, sorry. If someone could direct me to a better news group
I'd appreciate it. Didn't see a FAQ.

John,
There was an article in QST some months back (March I think) about this
subject. If you send a request to ARRL I bet they would be glad to help
you. You can send the request to info@arrl.org. Ed Hare at ARRL HQ has
been very helpful to me in finding thing out. If you send me a request
I'll give you his EMAIL address. If you got, or can find, a December
issue the index of articles would have this article listed. Then you
can go directly to that issue and read about it.

From: tonyh@gate.net
Message-ID: <3bvedj$lgp@tequesta.gate.net>
Source record: 222274

To All,

I am interested in selling two pieces of ham radio equipment. The first is a Icom IC-2KL 500watt HF All Band Linear Amplifier and the second is the Power Supply to go with it. I called a local ham radio shop and they told me the list on these two items is about $2700. Both items are in "brand new" shape in the box. I would prefer to sell it to some body in the Miami,FL area or at least in Dade, Broward and Palm Beach counties, but I may consider mailing it out. Also I would like to know what is fair market value for the following items: Collins 30-LI and Collins KWM-2.

All offers for the Icom equipment will be considered, I'm willing to sell them pretty cheap! Please send all replies to:

Tony Habermeyer
tonyh@gate.net

Thanks ;-)

6250. Best HF/WEFAX?

Newsgroup: rec.radio.amateur.equipment

DAVID>> The Standard C288 is a really good 220 singleband HT.

I share your sentiments. Standard produces excellent equipment, and
their Customer Service Department is also first class.

DAVID>> Major complaint for me is that you must purchase an
adapter to run the radio from 12V. There is no direct plug...must
remove battery and add the adapter.

I got used to this, with little effort. Even cut down a CNB184 Battery
slide-on cover to fit when I use the DC adapter.

Please consider (if you haven't already!) one of their leather,
form-fitting cases. All controls are accessible, the keypad is useable
under some clear vinyl, and it's saved the display from a scratch once
already for me!

> A couple of friends of mine and I are considering purchasing the
> ft900- anyone have any comments on operation of this rig? How
> does it rate up to the ft890, and KENWOODS TS50?

I have owned the FT-890/AT and have sold it and gone to the F-900AT.
Now mind you I use the rig for mobile and have only had the FT-900AT
for about one month now.

The FT-900 seems to have a better receiver than the 890. I would say
less prone to overload, strong signals near by the frequency seem to
cause less greef than on the 890. That is even true with the Noise
Blanker set on. The tuner seems to be better than on the 890, at least
seems to tune almost anything and does it FAST! I like the memory
system better on the 900, also the direct keyin for frequency is nice,
but just hitting the band selection button for a band is even better.
The 890 you needed to select the fact you wanted to switch bands, then
hit the up/down button.

> What kind of antenna would be best for mobile hf operation?
If you want single band antennas, that work very well go for the
hamsticks or any of their clones. They cost about $15.00 to $25.00
per band and are very light weight. If you want multiband, but still do
not mind getting out side the car to change a jumper, go for a
bugcatcher type. I use a Carolina Bug-Catcher myself. Cost is about $90
and works great on every band from 10 to 40 meters.

Now if you want to be able to band hop without going outside the car.
Get a screwdriver antenna. These are clones of the Don Johnson design.
These antennas can be built for around $100 and will work one 10 to 80
meters. Tunable from the car seat. You will never use an interrnal
antenna tuner with this antenna. There is several companies making this
antenna now, one that comes to mind is High Sierra. They sell for about
$300.

> Any news available on the outbacker???
I have used the outbacker antennas. The Perth works best of the bunch,
but I would go with the hamsticks. They work better overall and cost
1/10th of what the outbackers sell for. The fact all bands in one
antenna sound good, but in practice it is a single point of failure.

6254. LOSS OF AM RECEPTION IN AUTO

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-05 19:29:53 UTC
From: adams ashley <aadams3@gl.umbc.edu>
Message-ID: <3bvpnh$knu@news.umbc.edu>
Source record: 222278

I have over the past few years gotten used to excellent AM
reception in my '86 JEEP GRAND Wagoneer. Just recently the reception
has dropped of to where it's hard for me to enjoy a talk show without
losing half the show to static.I am an engineering student and know
how to use testing equipement, however I would greatly appreciate the
aid and expertise of this newsgroup to remedy the situation in a
juditious manor.
history:
excelent AM reception with good FM reception

pertinent data:
tuner is of marginal quality I.E. $130.00
car has slight rust, antanea area slightly rusted

problem:
poor AM reception
not a large difference in FM reception

my diagnosis:
antenea should have a better ground with body at mounting?

My father also has problems with AM reception. However, he
drive a brand new benz with a fancy $$$ radio. I am wondering that if
my problem is an inadaquit ground at radio mount then his problem
could be some type of faraday cage effect from the special rust
resistant paint those germans use ; Thus produceing the same effect
with different causes.

please excuse my spelling and my ignorance,I am trying
to remedy the later

all personal responces and posted responces are greatly appreciated

my adress is aadams3@gl.umbc.edu

I just purchased the above car, and noted in the owner's manual that "use of non-fcc approved radio transmitting equipemnt may interfere with the operation of the cruise control". This kind of sent up a red flag to me, after hearing about the problems with the (camry?) blowing it's engine computerwith ham gear. All of my stuff is commercial, unmodified, and legal (Alinco DJ-580, and a 2W in 30W out linear for 2M only), and of course FCC approved :). Has anyone had any good or bad experiences with this car? I really do not want to have to buy a new engine computer module!

Thanks!

6257. Need Ceramic insulator for tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-05 19:58:25 UTC
From: ham@wam.umd.edu
Message-ID: <3bvrd1$kdl@cville-srv.wam.umd.edu>
Source record: 222281
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I just got a Heath SA-2060A 3 KW antenna tuner from a fellow netter. Unbeknownst to him (and to me, for a few days), a single "pass through," two-piece ceramic insulator going between the metering unit and the tuner itself, was apparently overtightened at some point.

I heard a slight rattling sound when I picked up the tuner (uh oh). Upon loosening the screw holding the one of the big busses to the insulator, the compressive force was gone, and the insulator collapsed into about 15 pieces (only ONE piece of it, though - the other is fine).

HELP! Somebody recommended H.H. Smith as a manufacturer of ceramic insulators, but, heck, I don't know ANYTHING about these things.

Can anybody recommend a place to find one of these? It's an "L-2" or something, according to Heath. Yes, I HAVE called Heath, and neither they nor RTO Electronics (he repairs Heath stuff) has one around.

I need ONE! Not 10, or a hundred, or even TWO! Just ONE! Any sub-stitutions? HELP!

> model, marks, etc.)
> Thanks in advance for you help...

It'd help if we knew a bit about just what you want the antenna to do....
For example, I live in San Jose, CA, a metropolitan area with LOTS of repeaters.
With a dual band HT on a rubber ducky, you can reach most of the repeaters,
and talk simplex with lots of people. With a "minimal" antenna, on the roof,
you can do a bit better, less noise in your signal to the repeaters, more
simplex range, but too much antenna gain, and you could be worse off, as most
HTs have problems with intermodulation in high signal areas... And there's
also the (minor) "problem" of hearing the output of the "other" repeater, just
beyond your area, that keeps breaking squelch when you're listening for a friend
on a local repeater (same frequency, especially a problem if your local repeater
doesn't use CTSS tone access). If you're using a single band mobile or all-mode
unit, Intermod may not be a problem at all, and you may want lots of gain...but
maybe not. (really difinitive answer, no???)

On the other hand, if you're in a low signal area, and all or most of your
desired repeaters, etc. are in one direction, maybe a high gain yagi is the
way to go.... It's really difficult to tell where anyone is from their
internet address..

No matter what you do, I hope you have a good time with radio... It's a great
hobby. (I run a gain mag mount on my car, with a Yaesu '530 HT. At home, I've
a Ringo Ranger II dual band from Cushcraft, and sometimes it's too much antenna.
I'm getting ready to put up a small yagi if I ever get the time when it's not
raining, on an old tv rotator and see how well I can do on various out of area
repeaters.)

I would like to find out which equipment is the best to buy for amateur satellite work. I am interested in the differences between the ICOM 820, Yaesu 736r, and kenwood 790. Also , what additional equipment is required? Are there many dx stations using satellite during this poor sun spot cycle period?

6267. N1OWC needs help in finding pl generator for Ranger 2950

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-06 12:34:03 UTC
From: daholt@k12.ucs.umass.edu
Message-ID: <1994Dec6.123403.14862@k12.ucs.umass.edu>
Source record: 222290

I have a Ranger RCI 2950 (all mode ten meter transceiver) and I am looking for a pl generator, either internal or external for this radio. It seems to me that if Ranger was going to make a rig that could operate 10 meter FM, and has the frequency split option in the radio (to operate repeaters) you think that they would have put some way of generating the pl's needed to operate some of these repeaters, but alas they did not.

I have seen some external boxes in the "commercials" from different distributors in QST, but have been hesitant to purchase one because A: I am not an electronics wizard (yet) and have no idea how something like that would be hooked up, and B: I don't know if that particular unit is compatible with the 2950, and I want to make sure the unit will work with the radio before I lay out the cash.

Does anyone know where I can find this item? The radio works very well, and in my area (western Mass) there is a 10 meter unofficial SSB voice net that meets on 28.3540 at irregular times (I guess it really isn't a net, but it makes us feel good to call it one!) and everyone says that I have the best signal in the area. I use a cushcraft AR-10 ringo, and 25 Watts has got me into Alberta (VE6) territory before so I am very happy with the radio. I can't wait until 10 opens up for worldwide again!

I would also like to know if the radio is just a factory converted 11 meter rig, like so many people have asked me. I have told them that it is built as a 10 meter radio from the (chassis) ground up, and I wonder if I am wrong. I use the roger beep function if the band is noisy, and people also say that using one is going to turn ten meters into something like what 11 meters is like. I don't personally think so, and have heard that it is a good thing to use sometimes from one other person in the area. Any comments?

I know this is sorta long so thanks for your time!

73's DE N10WC = Dave = sk (finally (hi hi))

As a SSB and CW rig I really like my FT-890. I have just started to get
into RTTY, and it is a real pain to use for that. Mine has the built in
antenna tuner which is real nice also. I don't know too much about the
840. If you are interested in the digital modes I'd say go somewhere else
but otherwise the 890 is a nice little rig.

> Is the FT-890 really worth the extra $$ over the FT 840 ? What have >
> been your experiences with it? Are there any known problems, defects,
> etc. with it?

The 840 is a fine entry level rig. But most of the features of the
890 are NOT standard on the 840. And in many cases, are just not
Available. As to the price differance, it isn't that bad as soon
as you start looking at adding features. I just sold a almost new
F-890/AT for $975.00 look fr a deal like that.

> Why is Yaesu offering $150 rebates on it - is it being discontinued ?

Yes the FT-890/AT will be be discontinued for the new FT-900 is
taking over that point in the product line. I bought one of these
after selling the F-890/AT.

Source record: 222294

i'm looking for recommendations for a _real_ noise-cancelling speaker/mike that i can use with my ht (yaesu 470 / 530). the standard, small yaesu version seems to do nothing for noise-cancelling. i drive a particularly noisy car and often receive complaints that my transmissions have too much background noise.

are there any available noise-cancelling mikes or speaker/mikes out there?

i hooked up my aircraft headset for a while and it seemed to work ok. it is designed for an even noisier environment. not legal to drive like that, though. i have considered modifying either an aircraft hand-mike or maybe a used motorola mobile radio mike. don't know about the noise-cancelling characteristics of the latter, though. anyone tried one of these?

From: mclendon@brtph833.bnr.ca
Message-ID: <3c2avl$j0u@brtph500.bnr.ca>
Source record: 222295

Hello all,

The FT890 can be made to work digital modes if you have the 500Hz CW filter installed and (here comes the mod trick) install a dpdt 12 volt relay to select the CW filter instead of the LSB filter.

Then all you have to do to operate digital is: operate the relay to select the cw filter, switch to LSB, adjust the frontpanel IF passband control to center the FSK tones to your TNC (for my MFJ1278 tts abt the 10:00 o'clock position) and start typing!

Yaesu underestimated the popularity for the FT890 as a fixed station - bet they would have put in the digital mode switch or separate filter selection if they could have seen the sales figures. Oh well - I sure like mine for CW, SSB, and digital!

Cheers

6277. Problem with Kenwood TM-251A, DTMF and autopatch

Newsgroup: rec.radio.amateur.equipment

From: donahued@wc5.wl.aecl.ca
Message-ID: <6DEC94.19060213@wc5.wl.aecl.ca>
Source record: 222204

Hi,

A friend and I both have new Kenwood TM-251A 2m mobiles and both display the following problem with DTMF codes and the local autopatch.

(1) We store the DTMF code to access the autopatch into DTMF memory 0.
(2) We store the number to dial into DTMF memory 1.
(3) We store the DTMF code to clear the autopatch into DTMF memory 2.

We press PTT+PF and select 0, the autopatch activates as expected.
We press PTT+PF and select 1, the numbers to be dialed appear on the display and the DTMF tones are sent, but we get a message that "the call can not be completed as dialed, etc."

I tried the same thing with my HTX-202 and it all works fine, so there is not likely anything wrong with the autopatch.

We would appreciate hearing from anyone who has experienced this problem and has a solution.

Thanks is advance,

Dave 73 de VE4DCD

I am somewhat confused by the statement about the RTTY and digital modes. I have been running digital on everything from an old tube Kenwood 820 to my new Omni VI. I had the Yaesu 757 GX (not newer GXII) and ran RTTY, Pactor, Amtor and HF Packet. I had absolutey no problems.. I ran a few of the RTTY contests and did very well. I was using a PK232

Are you sure you have your rig and TNC connected correctly, and which TNC are you using. A shame to slam a nice rig like the 890.

6283. OMNI V OWNERS! Please read!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-06 20:38:56 UTC
From: ham@wam.umd.edu
Message-ID: <3c2i50$kh6@cville-srv.wam.umd.edu>
Source record: 222199
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Ten-Tec has a modification they do with the OMNI V to make its transmit frequency stable with variations in output power. It begins with a logic board that uses Vcc to select PIN diodes in order to select capacitors which will 'pull' the USB crystal into putting out the desired frequency (depending upon mode - different caps are switched inline).

With 5 watts out, I got Vcc = 13.6 volts. At 100 watts, I got about 13.05 volts (IR loss in the cable). This voltage switched the PIN diodes in - and as it changed, the current thru the diode changed! This led to (I'm guessing) a differing capacitance, pulling the xmit freq. some 40 Hz in CW mode!

The 81509 board sits above the logic board, found at the back left corner of the logic board, which itself is located on the top right side of the rig. It is a 5-terminal regulator, LM2931, with a few resistors and caps, designed to put out a constant 100 ma with the resistor choices made.

HOWEVER, I noted that mine wasn't regulating properly! Vo was following Vin pretty closely! TT sent me another board, and I put it in, with the SAME results! I got the app notes for the LM2931 and it turns out that with the resistors on the board, the board was regulating to 16.8 volts! Apparently, 352k was used, and 242k was desired (confirmed by Larry Boyd and Rick Long at TT). The plan was for 242k - corresponding to about 11.8 volts - but somebody apparently reached into the wrong bin when making up the boards!

CHECK YOURS! My original 81509 board was installed in August, and I got this second defective on in mid-November...

TT's number is 1-800-833-7373, or call or email me for my findings.

:descriptions in the manual are just plain wrong (one example is scanning
:between two user-specified frequencies).

To each his own I guess... I found the user interface to be one of the best I've ever used. I had no trouble remembering all of the commonly used functions and they seem intuitive to me. The manual is a little terse, but it contains concise descriptions of how to do everything.

My tests with the W21AT confirm good sensitivity in the ham
bands. Decent sensitivity up to about 170 MHZ. Deaf until 430 or so,
then good 430 to 460. Near deaf above 460. Nothing at all inthe 800
range.
I compared the radio to a W2A which was similar, except the W2A
was quite hot in the 800 MHZ range, while the W21AT was not.
I think of this as strictly a ham band only radio, and a rather
good one at that.

From: glowworm@polaris.unm.edu
Message-ID: <3c3brc$nik@lynx.unm.edu>
Source record: 222209

Ok folks.. after having my ticket for 15 months, I'm *FINALLY* getting a rig of my own!!! :)

And I've decided to ask the net.experts for recommendations.... (scary thought, eh? :))

Ok.. here's what I'm looking for..
2m/440 Handie Talkie... the only restraints that I've got on it are as follows....
Price must be under $400 (or very close thereto... the 'rents are buying it, and I can add a *little* bit if one that I want is more..)
Modifiable for extended receive.. (transmit too, if possible, but the receive is important as I'm taking the NREMT-B class starting in Jan and will probably be volunteering.. it would be nice to just be able to carry my HT and not an HT and a pager and.... :))

That's it.. I'm open for suggestions... :) I've heard really good things about the TH-78/79 series and the FT-530... haven't heard much about Alinco, Icom, or Standard.... but I'm gonna listen :)

I've got about a week and a half or so to decide before the 'rents get out here, and I'll let y'all know what I'm goin with... (oh, btw, for prices, I'm prolly gonna drive to Denver to HRO... if there're cheaper places, please let me know)

Thanks in advance,

Andrew

My experience with the 78A was that on a decent antenna (mobile or base)
the two meter receiver collapsed. It works fine with the supplied dummy
load, err antenna but if you plan to use it with any other, strong signals
will go away on 2m. The 470 and 530 do not exhibit this problem, I
haven't played with the 79A yet.
I hope this helps

: Hi Bud:

: I don't have a problem with your mail sig!

Neither do I! I think it's safe to asume that that other guy is still in the stone ages running 1200 or maybe 300 baud. HEHEHAHAHA :) As far as transmiting in a car, I have had no trouble in mine. The first thing you need to do though is to get rid of the rubber antenna! It won't get you far. Even if you use a 1/4 wave antenna on the HT contracted, you will still get better results. Also, I noticed almost a 2 fold increase in range when I added a 5/8 wave magnetic antenna for my trunk(Mustang). FYI: I'm running a Kenwood 22at with 3 watts power.

I'll 2nd Jerry's opinion. I have the C1208DA Standard (2-meter only
version of the above). I had no trouble programming it or rembering
any of the functions.

As far a ruggedness and resistance to intermod, however, I'll take
my other mobile rig, a Yeasu FT2500M, over ths Standard. The
Standard does give me the wide-band coverag that I wanted
though. It's a trade off.

6298. Rear Window Defroster & Glass Mount Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-07 15:27:23 UTC
From: kgk@nwu.edu
Message-ID: <kgk-0712940927230001@kgkmac.repoc.nwu.edu>
Source record: 222220

I have a 93 Subaru Legacy with a Larsen 2/70 glass mount antenna connected to a Yaesu 5100. It appears last night that the rear window defroster is no longer working. The light on the switch is on and the relay appears to click, but does not appear to defrost. I've had this setup since summer and really like the antenna, it has performed perfectly.

Is their any possibility that this could have caused a failure to the defroster (perhaps some interaction with the defroster in use and the radio on 50 watts) or is it just that the defroster failed for someother unrelated reason?

I need to have it serviced if it has failed (and I cannot fix it at home) and if the radio/antenna combo could not possibilly have caused the problem, it would be helpful to know that when dealing with the service department. (Just incase they try to blame it on something other than a normal failure, the car has the extended warrenty and just went passed the std. 12/12000 mile warrenty.)

Thanks in advance.

Ken

> for the money? Any replies excepted.

This is way too much money if it is used. I would say $650 to $750 is about the right price for the FT-840. If the supply is the matching speaker/supply then $200 is about right, but if it is a RS-20A from ASTRON then pay no more then $100 for it, and more like $80.00

By the way I have a friend that will sell his LIKE NEW, in the box, purchased at Dayton last April, less then 5 hours operation, witha never used mobile mount for $700.00.

I purchased an FT-840 last June for $799 and and Astron RS-35A power supply for $150. This was the average price from mail order and local dealers.

The Yaesu power supply was somewhere around $250.

Ken KD1XS

P.S. I have been very pleased with the 840. Very good receiver, plenty of features.

: 160m and/or QSK mods.

It would require major surgery to make it work on 160m. You would have to add a 160m tank coil (probably a large toroidal inductor), add a 160m input network and either replace the bandswitch with a 6-position unit or delete one of the other bands to wire up 160. You might also have to modify the filament choke and power supply bypassing.

6307. ICOM IC-H16 modifications

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-08 02:59:41 UTC
From: geret@gov.nt.ca
Message-ID: <1994Dec8.025941.15998@gov.nt.ca>
Source record: 222231

Does anyone have the programming instructions for the ICOM IC-H16 commercial VHF radio? I know it requires the removal of an internal jumper followed by keypad entries. I have tried to get the info from ICOM, but they havere-fused, citing a regulation preventing them from releasing it. They would, however, sell me a service manual which contains the information. So much for discretion! (Thanks ICOM) Anyway, I'm sure someone in Internet land must have the info. HELP!

6308. Cost to get on air as Novice?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-08 03:36:20 UTC
From: hmaxwell@netcom.com
Message-ID: <hmaxwellD0H3CL.Jt8@netcom.com>
Source record: 222236

I'm seriously considering getting involved with radio after years of fascination. The question is what a basic rig (used OK) would cost and whether it would be more frustrating than fun to have a limited license and somewhat limited equipment. I'm interested in both portable (hand held) and base equipment options.

If it would be foolish to start out small, I am considering waiting a bit longer and learning to qualify for a better license and and the equipment to make good use of it.

Any thoughts & information appreciated.

Source record: 222232
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment

I am wondering the same thing. I was at HRO today and the 820H is $100 cheaper than the FT-736R. I use an FT-736R at school and I like the radio although some functions are far from intuitive. I still don't like the way the memories work. This radio has more features than the Icom but its older design (as reflected in no 9600 baud) is its biggest disadvantage.

I am tempted to buy the Icom beacuse of its advertised 9600 bps "plug and play" and its smaller size. I don't want to shell out my cash until iv'e heard from some users. I am primarily interested in working the microsats, both 9600 bps fm and 1200 PSK. Although the Yeasu will do 9600 after mods, the thought of paying almost $2k for a radio and then wiggling capacitors until they break off and the like doesn't appeal to me.

If anyone reading this is using any of the three radios mentioned above, I'd love to hear what you like / dislike about your radio as well as your other equipment and modes that you work.

6318. YAESU radios

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-08 15:42:44 UTC
From: denzil_b@oldham.gpsemi.com
Message-ID: <D0I0z9.A3E@lincoln.gpsemi.com>
Source record: 222243

My apologies if this seems like an advert, it isn't meant to be, merely a thankyou for support from YAESU. I'm not a radio amatuer so I don't normally subscribe to this newsgroup, I'll look in for the next few weeks but if anyone would like any more info contact me by Email.

I was part of the British Medical Expedition to Everest in Sept and Oct of this year, and we needed to borrow some handheld radios plus base set for communications. After talking to other UK and European manufacturers, without any positive response, we spoke to YAESU:-

"8 VHF handhelds plus a base set plus an HF set - should be no problem I'll just check with the president back in Japan."

"They will need some spares - call it ten handsets, 2 base sets and 2 HF - oh and ship them all back to Japan for environmental chamber testing before they are sent out to BMEME"

Brilliant!

All the sets worked a dream for the 2 months. The only problem we had was with the mains powered chargers running off the generator at Everest Base Camp (17,000ft). The ni-cads had problems with the low temperatures so we ended up using alkalines almost all the time. We could get up to 4 days operation from a single set - with 9 hours monitoring and about 10 mins transmission per day.

Being used to Philips PF85 at 86MHz (mountain rescue in the UK) the performance at 144MHz from these YAESU sets was stunning - one notable contact was from base camp at Island Peak (18,000ft) to Everest Base Camp (17,000ft) a distance of only a few miles, but it just happens to have the Nuptse-Lohtse ridge in the way at 26-28,000ft.

We tried to get HF contacts back to the UK (call sign 9N1SC - the first foreign amatuer radio license issued in Nepal, and the first ever for Everest Base Camp) but only managed one contact. Numerous Indian, South African, German Finnish plus the odd Italian contact. The main problem even with a 4 element beam (now that was a challenge to put up on the top of a mast!) was the surrounding mountains limited the signals we could put out. We tried long wire inverted V and a ladder aerial but the beam was best.

All the handsets came back scratched and dented, but they still worked in conditions down to -20C (at least that was the lowest temperature I encountered) though that plays havoc with the batteries - the battery low flag stays on permanently.

(We're presently negotiating a decent price for us to buy some slightly used radios, after all what would YAESU be able to do with them!!!)

Go for Novice and Tech to get both HF and 2m privileges. Actually, if
you get going on the code, you might even find (as I did) that the 13 wpm
test for the General is doable in your first try. The sooner you get
going, the sooner you'll have all the skills you aspire to.

Re: equipment, I think you have the right idea to be thinking of some
used items to get you going. A brand-new, right-out-of-the-box rig
is great if you don't mind spending the money, but let's face it:
not everyone has it. While I did buy my Yaesu 990 new, my 2m HT
an antenna and some other stuff have all been used. As a rule of
thumb, ham equipment is like other consumer items: once you take
it home from the store, its fair market value is about 2/3 what you
paid. So if you can find some "like new" stuff for about 1/3 to 1/2
off, I'd think seriously about doing that.

Where should you look for some good deals on used equipment? Well,
right here on the internet is great: try rec.radio.swap. Watch
the ads for something of interest at a price you can afford. Make
an offer. If you've decided you have your heart set on a Fritzbar
5000 and no one's offered one, post your own ad offering to buy
the first one presented at your price. Maybe someone will respond,
maybe they won't but you don't know 'till you try.

Other places to look are Amateur Radio Trader (1-800-77-HAM-AD),
and the classifieds in QST, CQ, 73, etc., though often the time
lag between when the equipment was offered and when you read about
it may mean anything really good is long gone by the time you find
out about it. You can also check out the flea markets run by the
local amateur radio clubs, though my experience is that's a better
place to look for a good buy on PL-259 connectors than on an
actual working rig.

The key thing you'll need if you want a good deal on used equipment
is patience. A lot of folks have very foolish ideas about what

their stuff is worth, so if you're in a rush, you'll grab the first deal and pay way too much. You do have to be prepared to let it get away. No matter. There is no such thing as the Last Good Deal. Keep watching and waiting 'till you find a deal that really meets your needs.

Some people worry about getting taken and I'm sure that does happen. But personally, I've been very fortunate. Everyone I've dealt with on the net has been totally honest. I've sent my money and the stuff came and it was exactly as described and agreed. I personally have no qualms about buying used equipment this way and I doubt you'll have any problems either.

Back to the bottom line: I expect you should be able to find a nice used solid state 100W HF rig for about $400. If you'd accept an older tube model, you could get something for about half that. A fancy unit with digital freq display might start at $600 or $700. These are off-the-top of my head kind of numbers, not based on actually shopping around but, rather, just on my rough guesses. YMMV.

For 2m, get yourself an HT. Any HT is better than none. :-) Figure you should be able to find something minimally acceptable for about $125, give or take. A fancy unit used might be in the $250 to $300 range.

Hope this helps.

Here's a caveat. Several months ago, I telephoned in an order for an antenna to The Radio Works, located in the Norfolk, VA area. Got their catalog at the Charlotte, NC hamfest. I used my major credit card to order over their (long-distance) order line. "If there's a problem with your order, we'll let you know," said the voice on the other end. About 2 weeks later, not having received my order, I started calling (at my own expense, again) to inquire. Several times I got their answering machine. I explained my plight and asked for a return call to let me know if anything was awry. No return calls. Then, after about 2 more weeks, I called back and by some stroke of luck got a real, live person. "Your credit card was refused," she told me curtly. I explained that the card had a $10K credit limit with zero balance, but she was adamant. Asked why she hadn't returned my calls, she said, "We can't return all those calls." As far as I know, most of "those calls" are probably from CUSTOMERS - who are supposed to be the lifeblood of a retail organization. Apparently they don't understand that. A letter written directly to the CEO, who is a ham, yielded no response. As a friend of mine said once, the customers are profit, the employees are OVERHEAD! Needless to say, I will NEVER buy anything from this company again. BTW, the next day I called in the order to Ham Radio Outlet, using the same credit card, and got the order in 3 days.

For what it's worth.

: seems to do nothing for noise-cancelling. i drive a particularly noisy car and
: often receive complaints that my transmissions have too much background noise.

: are there any available noise-cancelling mikes or speaker/mikes out there?

Todd, I had similar problems with my HT and with my mobile rig. When
using the HT outdoors, even a moderate breeze would cause objectionable
noise.

I found that the audio was too "hot" -- if the rigs had had audio gain
controls (instead of just deviation controls), I could have turned down
the microphone gain.

Instead, I just swamped out some of the audio by placing a resistor
across the mike element in each rig. After swamping, I find that my
desired audio is still satisfactory (I'm a "close-talker" anyway) but
the undesired background noises are cut way down.

The resistor value needs to be determined empirically (and is different
for each rig). I think one of mine is 4.7k but of course your mileage
will vary. You might try a pot across the mike while measuring your
deviation on a service monitor or having a friend with an "educated ear"
give you reports.

I use the 736r and it seems to be the workhorse of the satellite
crowd. It is quite an easy and intuitive radio to use. I guess I
don't understand your comment about the memories. You might not
know a trick that is not documented in the English manual.
To load a memory to a VFO without affecting the memory, as it
would be if you did a memory exchange, you do the following.
Select the appropriate more ie satellite reverse or normal.
Press MR, select the memory you want to load to VFO. Then you
press the FN key and then the VFO key. The memory contents
are loaded into the VFO and the memory is not affected. I have
my OSCAR memories set up to tune up. My frequencies are in the
CW bandpass and transmit is set to CW receive to USB. Thus all
I have to do is turn on the VOX and tune the transmit frequency
till I can hear my CW on the downlink. Actually I leave the satellite
selector switch in the transmit position during the memory VFO loading
process as saving one step. I can be loaded and tuned in seconds.
Usually I am ready before the KCT has positioned the antennas.
The big advantage of the 736r is the two modules you can add. I like
to work 6 meters when there is not a satellite window. The Icom is
smaller if that matters to you. The 9600 is a non-issue. The mods to
the 736r are easy but you should also change the IF filter. I am
currently trying a IC-281H for the 9600 birds and I will post my
success or lack of same. Good luck 73 de Jerry

I have an FT840 and am generally impressed. The only thing I don't like about the radio is it doesn't do too hot a job on adjacent channel interference, but then I guess the guy down the street who runs a linear would interfere regardless of the rejection.

But seriously, it's a good little radio and a great starter.

Ok.... got some interesting advice on dual banders... leaning towards the FT-530.. *particularly* since Yaesu's running $50 off till the end of the year.. got an HRO cat in the mail today and was looking thru it... got a couple of questions...

First: what're the specs on the FT-51r.. and the street price, since that's not in the "newest" catalog at all... :(
Second: what have folks heard about the Alinco DJ-582T? (their new one--the upgraded 580) It sounds more or less ideal from what I've read.. but I dunno. If anyone's heard anything about it, please let me know :)

Thanks,
Drew

>: Charles Hohenstein
>: n9sqe

I have to agree with these two guys. I'm running 50W into an attic dipole
and have worked 25 or 30 countries in sporadic operating over only five
months. Those countries include Uganda, Tahiti, French Guiana, Belize
and the Madiera Islands. I operate CW almost exclusively, and I'm sure
that helps. Remember: we're near a sunspot minimum!

Try an indoor antenna. Don't let the hams on 100-acre farms have all the
fun!

>I'm seriously considering getting involved with radio after years of
>fascination.

Helene,

The cheapest, yet good way tu get on the air will be to buy a s/h
HF rig. Some nice rigs w/o general coverage RX and may be with
tube PA will sell for somewhere like 300$.

The advantage of a ham-band only RX may be better immunity to broadcast
interference, the advantage of tubes is that the output Pi network
may be tuned such as to accomodate a mismatch. (saves the ATU).

Making use of a novice license is may be the best way for
training for some thing better.

Critical is the antenna. To save money, make one from wire and make
it as big as you possibly manage. (A long wire strung along lamp posts
down the road easily outperforms super-all-band-no-tune-verticals).

Have fun! Moritz DL5UH

6335. Do indoor antennas work? Yes.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-09 14:43:32 UTC
From: ham@wam.umd.edu
Message-ID: <3c9qek$c05@cville-srv.wam.umd.edu>
Source record: 222160
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I have always had an indoor antenna due to living in a townhouse with covenant restrictions. I was worried at first, as "all that ductwork" would get in the way.

After a fair amount of fairly casual contesting and hunting out the good DX with a fine-toothed comb, and making sure to only run 50+ watts when I have to (wouldn't want to nuke myself), I am now, after about 6 years of operating, at 93 confirmed on CW and 96 on SSB (about 138 total).

All but two were made with the dipole (T32 and a ZK1, made from a friend's house, and both on SSB).

Just be warned of the unknown effects of HF RF on human and canine and feline body tissues (or just human if you have no pets), and of the fact that if you're in a townhome, your neighbors are unknowing guinea pigs. A GOOD reason to run QRP. Yes, you can work DX QRP with the indoor antenna, except it requires big antennas on the other end.

Fortunately, lots of Europeans and South Americans have these big arrays.

It's probably a noisy volume control pot. Try spraying some Quietrol
on the pot and working it a bit. If that doesn't help, you may need
to replace the pot.

>
>Any thoughts & information appreciated.

Just do it. Few hams are satisfied with their first rig. One of the
continuing joys of amateur radio is plotting and dreaming for a better
rig. The ham fleamarkets are filled with used rigs, most of them just
fine, because the ham found a rig she just had to have to replace it.
Don't worry about choosing wrong because you'll certainly want something
different soon anyway. Go for the Tech or Novice license and just jump
in. Buy used and you'll be able to recover most of your investment when
you want something different.

I use a Brother P-Touch electronic labelmaker to make labels for
the panels of electronics gear I build.

Although I use the most common labels -- the type with adhesive backing,
you can purchase dry transfer cartridges for the P-Touch.
For the dry transfer variety, you use the P-Touch to print the label,
then use a stylus to rub the lettering onto the panel.

I have a used Alinco DJF1T - high power (5 watt) two meter HT for
sale. It comes with the five watt (12 volt) battery pack, a dry cell
case, a speaker mike (the one from Alinco, with remote functions), the
optional tone decoder (PL board), charger, manuals, etc...
All of this combined new would cost about $400. I will
sacrifice for $200, or any reasonable offer. I will also throw in
a DC power cord for mobile use for free.

I'm pretty sure that it's in the control head in kind of an obvious
place. I think I remember seeing it when I was doing a mod awhile
back, but I'm not sure.

I've had a TH 79 for about 6 mo and its intermod rejection is far better than the TH 22, its smaller 2 mtr HT. With regard to the 530, it is a real handfull, whereas the 79 can be easily pocketed w/o someone thinking you're carrying a .50 Cal Desert Eagle Auto. The 530 I know has the tone seek on the repeaters, as well as the lighted keyboard, but I have never needed the former and rarely needed the latter. TH 79's only fault is that it does not currently have the ability to block out an channel from a scan. I like to carry my HT at all times and the 79 is hands down the best for this. Have you seen them side by side? Do so before buying. Also, if you use an antenna better than the rubber duck you must get an intermod filter. Call Tucker in Texas (800)

For my TM-721A:

The lithium battery is on the back of the control PC board, that the
front panel knobs and switches are attached to. It sits behind the
main band display.

The Kenwood Part number is W09-0326-05 but I can't find any
insustry-standard part reference.

If you have any trouble finding good strong magnets, find a dead
microwave oven and scrounge them off the magnetron tube. You get
2 *very* stout 3" magnets, just don't get your fingers between 'em
or let them slam together (breakage). I come across old microwave
ovens frequently at the landfill when I do my semi-annual workroom
cleanout. Not to mention that it helps to carry something out, since
we have to weigh in and out at the landfill ($). Now if I could just
find a use for those 1000v 1A (or whatever they are) transformers!

I liked the Standard 5718 so much that I have installed one in each of our
family's vehicles. Contrasting to my Yeasu, Kenwood and former ICOM
dual-banders, I have found the VHF intermod rejection far superior on the
Standard. However, the UHF seems more"open" compared to the Kenwood and
Yeasu...hence more intermod on UHF.
Still waiting for the ultimate tri-bander......

Jeffrey, AA9GP
```

6350. For Sale: Yaesu FT-747GX w/remote head, Yupiteru MVT-7100 scanner

Newsgroup: rec.radio.amateur.equipment

Yaesu FT-747GX w/FM board option and nifty remote head option (rare).
Perfect mobile rig for hard to install vehicles. $700 obo. This is
the only other remote mount HF rig besides the new Yaesu FT900 at > 2x
the price. I hate to say it since I just bought the FT900, but the
FT747 seems to have less noise in the receiver when you compare them
located in the same place with the same length cable, grounding, etc.

But, of course, I *need* the bells and whistles :-) That's why I'm
selling the 747.

Yupiteru MVT-7100, AM/FM/WFM/SSB, ~2mhz-~2ghz, 1000 channel scanner,
brand new in box. Purchased in Tokyo a couple of months and has been
unused (I have another). English manual. The ultimate scanner - ask
around! $550 obo.

: (best cheap = best value)

I think the best $300 hf rig is a used Kenwood TS950SDX...
...of course you have to wait for the estate sale. ;-)

Seriously, Iv'e purchased several Drake pairs for around this price.
They are getting harder to find at that price, but they do come up.
You would be hard pressed to find a better preformer at twice the price.
Any of the transmitters will work with any of the recievers so look
for:

Transmitters- T4X, T4XB, T4XC
Recievers- R4A, R4B, R4C

Any of these pairs should include an AC-3 or AC-4 power supply housed
in an MS-4 speaker cbinet.

There are certainly other rigs worth considering, but the Drake's
are a "sure bet"

As for the 2meter rig, don't know, maybee someone else will.

6353. Advice/Help needed converting VHF micor for ham use

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-10 07:59:28 UTC
From: rbauer@ecst.csuchico.edu
Message-ID: <3cbn50$efd@charnel.ecst.CSUChico.EDU>
Source record: 222175

I have just become the proud new owner of a Motorola Micor
VHF radio. It was previously used by law enforcement and
there has been no work done on it yet to convert it for use
on the 2m band.

I was told this conversion is simply a matter of obtaining the
proper transmit/receive xtals and re-tuning the radio. However,
I've never attempted this before, so from my vantage point, it
looks pretty difficult.

I'm guessing that what I need to start with are the proper
xtals and a service manual. Is Motorola the best source for these?
Or can I get them elsewhere for less?

Also, what kind of equipment do I need to retune the radio? Although
I suspect this info. is in the service manual, I'd like to know
just what I am getting into, before buying the parts, etc.

I know there's a large number of hams who have converted Micors
out there, so responses from these folks would be ideal. However,
I welcome and appreciate all the help I can get!

Thanks,
Robert

>and legal (Alinco DJ-580, and a 2W in 30W out linear for 2M only), and of
>course FCC approved :). Has anyone had any good or bad experiences with
>this car? I really do not want to have to buy a new engine computer module!

I drive a '92 Escort GT (same 16V engine as the '92 LX-E) and run an FT-5200 dual bander with no trouble at all with any "on board" systems. I have experienced cruise control problems in rental cars when using my hand held, even without an amp (Sables and T-Birds). Getting the antenna outside seemed to help but I don't like carrying mag mounts in my airline luggage.

The trouble was when the cruise control was set and controlling the speed: Key up on 2M at 1.5 watts (rubber duck in the car), the cruise would disengage and the car would slow down. Release the PTT and the cruise would re-engage assuming the new, slower speed. On 440 the cruise would disengage but had to be manually reset to assume any speed. I never experienced any uncommanded accelaration or anything I felt was dangerous (doesn't mean it couldn't happen). It was just annoying.

Your best bet to prevent trouble is to do a good antenna installation to keep as little RF from getting into the car's wiring as possible. In my GT, I put the transciever in the back (trunk) and mounted the control head up front. The ran power wiring, both positive and negative, directly to the battery and included a chassis ground to the car body near the the radio. (If you run pos and neg to the battery be sure to fuse both sides.) I punched a hole in the roof (there is room behind the power moon roof gear) and NMO mounted my small Diamond dual band antenna. This insured that the coax shield had a good ground to the car chassis at the antenna and at the radio connector.

You might consider remote mounting your amp to reduce the coax run. You'll likely want to install a remote power switch on/near the dash and a good relay to power the amp. Don't cut corners on the wiring you install.

In my experience installing commercial two way and cellular radios almost all such car problems could be attributed to what we called "stereo shop installs". Good installation practices are your best bet. Just about any car can tolerate a 50 watt radio if you install it properly.

Good luck

Try calling International Crystal Mfg. Co. in Oklahoma City. 1800 725-1426.
I have been happy with their products (though I've never asked them for MT500
elements - I get Micor rocks from them.) Don't expect them to be cheap and
the lead time will likely be a couple of weeks or more.

Hi Gang,

I would like to build/buy a Computer driven repeater controller. I am aware of the Commodore 64 implementation but I am looking for something a little more robust and full featured that would run on a 80386 or 80486 host machine.

One of my sites would seem ideal for trying such a controller as it is not very hostile.

Does anyone have any suggestions, comments or leads?

Also, if there is a better forum than this for Repeater Owner's / Operators / Trustees then please advise also.

Thanks in advance.

Cheers ... Phil Usher - KM6AA

6361. reviews of 2m ht's

Newsgroup: rec.radio.amateur.equipment

From: charnoft@wfu.edu
Message-ID: <3ccsdn$bp0@eis.wfunet.wfu.edu>
Source record: 222181

Something that seems shamefully absent from the faq for
this group is a file listing reviews for 2m ht's. (Or am I
painfully unaware and such a thing really does exist? If so,
please tell me.) So, fool that I am, I propose maintaining one.

If you have a review for a 2m ht (or perhaps a dual
bander) please e-mail it to me. If the file grows to a useful
size, perhaps it can be added to the faq.

I'm looking for specs, thoughful reviews, and useful
comparisons. I don't want "I've got a So-And-So-123 and I like
it."

Personally, I'm no expert. (I've only got an htx-202,
and, yes, I like it.) So, please, don't ask me for advice.
But there are a lot of experts out there, and it would be useful
to have their opinions in one place.

Jim,

The lithium battery is in the display head. I don't have the unit in front of me; so, I'll give you a description as I can remember it.

On the back of the display head there is a cover that is about 1" by 1.5" with screws holding it down. Remove the cover and you should see the battery. It's about .5" in diameter. Use caution since I'm giving you a description from memory and you know how that goes.

Good Luck,

Bob KE6GTI

Helene Maxwell (hmaxwell@netcom.com) wrote:
: I'm seriously considering getting involved with radio after years of
: fascination. The question is what a basic rig (used OK) would cost
: and whether it would be more frustrating than fun to have a limited
: license and somewhat limited equipment. I'm interested in both portable
: (hand held) and base equipment options.

It depends on what you want to do and how much you want to spend. For VHF
a hand-held transceiver (HT) would do fine. You will probably want to get on
2 meters as that band is used for short range communication almost everywhere.

You can get the RadioShack HTX-202 for about $230 new and I have seen
them on swap nets for as low as $130 used. The radio works well and has
all the features needed for use in most areas.

There are other similarly priced used HTs around, but many lack CTCSS (a
sub-audible tone that is used to "unlock" repeaters).

For VHF or mobile use it is more difficult as the vhf base rigs are very
expensive, the moble ones are expensive and there are few used ones on
the market. They get used for packet (digital) radio instead of being sold.

For HF, you can buy a used rig for as little as $100 for an old
heathkit or similar radio. You can buy a new 40 meter CW (morse code)
QRP (5 watt) radio from MFJ for about $160. With a dipole made of about
$10 worth of wire, you could have blast.

: If it would be foolish to start out small, I am considering waiting a bit
: longer and learning to qualify for a better license and and the equipment to
: make good use of it.

IMHO it would be foolish to wait. The sooner you get on the air, the sooner
you meet other hams, the better you are. But before you do anything, go find
a local club. There you will get help, advice and probably offers of
equipment.

You should post your location in your messages. I could give you more
information if I knew (generally) where you lived.

73,

Geoff.

First, can someone post the faq please or let me know where I can get it.

Also, I am interested in getting into amateur/ham radio. (Is amateur and ham radio the same?) I know it involves getting a license. I have also heard about repeaters and how it can "lengthen" the communication distance. What is involved with setting up a repeater and the cost of setting it up? Is it easy to set up? Do I need to get a repeater license?

If you can help answer these questions, please email me as I don't read here often. Although, I will read here more if I get a license!

Thanks for helping.

Message-ID: <93.6810.7583.0NFB7446@woodybbs.com>
Source record: 222059

I bought a used Alinco 570 for mobile use. It works fine..... except

It is supposed to cross-band from 2 meters to 70cm and then flip-flop
back to transmit 70cm to 2m. It will do either, but not both. COnfusing?

I can retransmit 70cm to 2m no problem.
I can retransmit 2m to 70cm no problem.
BUT the rig is supposed to switch back & forth so a QSO could occur with
me on one band and the other ham on the other band. I've handed the rig
off to another ham with a 570 and he is as puzzled as I am. The owners
manual says almost nothing about cross-banding. I realize that this rig
may be defective, but I still can't help but wonder if it isn't simply a
"programming error"- something I don't know about that needs to be pushed
or toggled on/off. Any DJ-570 ALinco users have any comments??

I have been looking at the TS-50S for an HF mobile rig for a while. Does anyone have comments in regards to remote mounting the front control panel of the FT-900.

Someone told me that the FT-900 has a very limited access to the radios features. Unlike the TS-50s which seems to have all of the features accessible either on the front panel or the menu selections (which can be brought up via microphone program buttons).

I really like the full access to controls rather than having to get out of the car and into the trunk area.

Any comments appreciated!

The best thing you can do is to find a local ham club and attend some meetings. Join the club, make some new friends. There are very few people more friendly and helpful than hams. Have fun with your new hobby.

I would be interested in hearing from any TS-50S owners. How do you like this rig? What do you like/not like about it? How does it compare to other radios That you have owned? Are you using the computer interface and if so what software are you using? I am considering replacing my R-1000 and IC-740 with this rig. The R-1000 has a Collins 1.8 khz mechanical filter and the IC-740 has 2 500 hz and 2.4 khz crystal filters. Do you think that the TS-50s would be much of a replacement for these two radios. Please send me your opinions, biased or otherwise!!

>can be adjust.
>
> Why we need to change the insertion loss ? What will change when I
>adjust the insertion loss ?

Michael, the adjustments labeled insertion loss control the input and output coupling of the cavity (internally they are adjustable loops). Tightly coupling the input and output will decrease insertion loss, but will also lower the loaded cavity Q. Lightly coupling the input and output will increase insertion loss, but will increase the loaded Q. The loaded Q of the cavity determines how wide the bandpass will be and how steep the passband skirts will be. If you want a really tight filter with a narrow bandpass and sharp skirts, you have to accept more insertion loss. If your bandpass requirements are somewhat more relaxed, you can tighten coupling and reduce insertion loss.

: Any comments appreciated!

I really dont worry about mounting my TS-50, I just sit it in the right seat and take it with me when I get to work. If it is not in the car, it can't be stolen from the car :-)

Yes, all of the features, (filter, power, AGC, plus many, many more) can be accessed from the front panel, but I dont suggest fiddling around with it while you are driving in traffic. HOWEVER, there are 4 function keys on the microphone that can be programmed to do any function that you want. Like so many of the computer-based modern radios, the more you use it, the more you learn.

-->Hi!
-->
-->A couple of friends of mine and I are considering purchasing the
-->ft900- anyone have any comments on operation of this rig? How
-->does it rate up to the ft890, and KENWOODS TS50?
-->

I recently sold a TS50 and bought an FT900.

In my opinion the FT900 is a far better radio. The receiver is much quieter and the controls are more user-friendly. Many more controls are accessible from the display in a logical method instead of the menu method which requires a copy of the manual to be handy for the TS50.

The remote-head is very easy to read and contains most of the necessary funtions with the exception of the direct-frequency keypad. Unfortunately the remote head requres 4 tiny screws to hold down the heads on the remote cable to be installed, making it more of an effort to install & remove the kit.
The radio is well suited to be a "base" rig with the head on the body. It is larger than the TS50, but most mobile users will use the head detached making it nice for limited space cars. I mount the head on the lip of the dashboard right in front of the steering wheel. I can spin the VFO with a finger while keeping both hands on the wheel. There is also a speech processor which I dont remember there being on the TS50.

One stupid thing Yeasu did was requiring significant dissasembly of the radio and requiring soldering to one of the pc boards to install the optional filters. They could take a lesson from Kenwood about the plug-in filters.

My overall inital impression is that this is an excellent radio, much easier user interface than the TS50, and better suited to be a double-duty (mobile & base) radio than the TS50.

>Dorr Depew
>N4QIX

I had a similar credit card experience, however the vendor (Brian Beezley,
K6STI) was certainly more interested in the customer than your experience.
He sent a note in the mail that the card was refused. I called him again,
and he agreed to try my card again. Then after a half hour or so he called
me back and said that the charge worked. He explained that the new automated
no actual person at Visa charge procedure seems to reject the card even when
the card is good but the charge facility is too busy. He said that he did not
realize this previously and apologized for my trouble. Sounds like the Radio
Works people could learn some good business practice, as well as some good
manners.

Source record: 222072

I have a ts830s that has served faithfully for years. I recently added
a beverage antenna to the W8CAR antenna garden and would like to be
able to use it while transmitting on the vertical. I have the transverter
plug with the antenna line BUT am afraid that the power picked up
by the receive antenna will do BAD things to the receiver front end.
The receive line is directly connected to the receiver at all times.

Has anyone had luck with using a relay to ground/disconnect this
line on receive ? Any help will be appreciated.
(Yes, there is measureable power coming in on the beverage!)

Message-ID: <9412130905.AA3355@smtp.UB.com>
Source record: 222081

Greetings,
I just aquired a used Yaesu FT-767GX. It appears to have one problem. The antenna tuner can't seem to find a match even into a dummy load. The dummy load is a Heath Kit gallon can filled with oil. Directly the load present a 1.5 SWR (as measured with an externa SWR meter as well as the 767 meter). When I envoke the tuner in the 767 the tuner hunts and hunts. Sometime it acts as if it will never stop and other times it stops within 30 seconds. The end result is an SWR at 2.1 according to the 767 meter. Has anyone else experienced this type of problem? If so, what is the corrective action. Does anyone have a service manual for this radio? If so, drop me a note so we can talk about it. And yes, I knew the tuner had a problem before I bought the rad io. Any help will be greatly appreciated. Thanks.

6409. Diode matrix on ICOM IC-M12 tips?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-13 13:35:22 UTC
From: dgibbs@aber.ac.uk
Message-ID: <dgibbs.35.00F75FAA@aber.ac.uk>
Source record: 222086
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

I wonder if you can help me,

I have an IC-M12 which has an internal diode matrix for choosing the frequencies of the various switch positions, but I can not find any information on how the frequencies are encoded in this matrix.

Does anybody have any information at all about how the encoding works, so that I can adjust the frequencies. There is a matrix positions table on the inside of the case, which gives a lookup of which diode position gives which setting, and the possible settings are labelled as follows :- 400,100,80,40,20,10,8,4,2 which looks like they provide some form of division ratio.

For example, Channel 16 is set to 400 + 100 + 40 + 4 = 156.8 MHz

Has anybody any information that they can pass on to me about the conversion from this divide ratio to the actual frequency used? Or any information about the IC-M12 otherwise?

Many thanks in advance,

Dave, GW7OVV.

I would like to hear from any FT-840 owners. What do you like/dislike about this rig? Have you put any optional filters in it? Are you using the CAT interface? If so what software are you using? Do you like the interface? How is it on AM receive? I am considering replacing my Icom IC-740 and Kenwood R-1000 with this rig. Any comments on the FT-840 will be gratly appreciated!

6411. TS50S vs YAESU 900

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-13 14:31:00 UTC
From: pve@dg13.cec.BE
Message-ID: <2EEDB0F4@smtp>
Source record: 222088

The following are personal observations on the TS50S and the 900 (both purchased at HRO). But anyone would noticed them:

- The TS-50S is small. It's a great package, has very few buttons, and an easy to read display. You can buy a lap top carrier case, put it in, add a flat PS, tuner (I have the MFJ 949D mobile tuner), dipole and cabling and your are all set. It's the future and I presume that in about 6 years, when Kenwood introduces a new mobile rig, the new one would be even smaller that the 50S. However, the lack of buttons means that if you dont like what you are getting, you cant really adjust much. It doesnt even have an SWR indicator (pity 'cause the circuitry is all there to protect the final, so why couldnt they include it in the display?). It doesnt have VOX (big problem for me). The programmable mike is fine too as is the digital power change. I used the 50S extensively during field day, connected to a 10A battery (bought from Ham Contact) connected to a regulator, connected to 82W solar cells. The manual is great to read (see Nov QST, page 13).

- The 900 is bigger, much bigger than the 50S. In fact if it didnt have the remote panel, I woulnd have bought it. Thus the cost is the basic price $1274 + $50 for the remote kit (compare that with $990 for the 50S). It has an SWR indicator. It has VOX. Voice Processor. a variable power control down to 5W. The manual, although it has many drawings and illustrations, fails to point out things like the reset switch in the back of the front panel and it fails to talk about the panel as a separate entity.

Operating them both, they have the same amount of memories (100), they both have very good noise blankers and they both have good audio(the 50S is more noisy however) that can be tailored to your voice characteristics. However:

- The 900 had the stupid system in that, when you save to memory and read from memory you use both VFOs. Thus if you want to read memory location 10, and you are currently using VFO-A you also update (read:alter) VFO-B. There goes my use for VFO-B as a marker for specific frequencies. This should have been a choice.

- The 900 needs plenty of cabling (power, antenna, front panel) from the back to the front dash. You must turn off the panel speaker to use the jack on the back of the front panel with a manual switch(took me long to find out about this jack - it's not labeled on the back of the front panel). Why cant the computer of the front panel tell the main unit, via the serial intereface, that there is a speaker connected to the front panel therefore turn off the main speaker?

- The 900 uses an RJ-45 connector for the microphone. This is an 8 pin connector normally used for twisted pair local area networks (these are called 10Base-T). Without a special crimping tool you cant use one. But they

are dirt cheap (5c in qualtities). For me with all the tools available here, the 45 is great. But for 99.9% of the hams it would be a pain to work with.

- The 900 VOX switch is on the main panel. Thus to operate VOX, you must stop the car, get out, go to the back, turn VOX on by pressing the VOX switch, close the doors carefully not to make too much noise. and repeat such operation to turn it off. This is pathetic. Why couldnt Yaesu control the VOX with the computer through the remotable front panel? The processor switch (which is in the front panel) should be changed with the VOX switch.

- The 900 has SUPERIOR AUDIO. As soon as I turn it on, the 900 exhibits beautiful audio with very good noise characteristics. In fact I thought there was a problem with the antenna, but it's just that noise is very low.

- The 900 has an SWR meter and ALC indicator. And a great to read display. However, in a difference from the past, pressing the GEN button turns on the GEN light on the LCD which in the days of the 747 would mean that GENERAL coverage during transmit is enabled - not the same meaning here.

- Tuning facilities, the 50S beats the 900 easily. You can prpogram the tuning steps for either SSB or AM/FM for the up/down buttons in various steps (50Hz, 100Hz, 1KHz, 5KHz in SSB) or (1KHz, 5KHz, 10KHz in AM/FM). The 900 has no such options. You use the UP/DOWN switches in combination with the FASTand GEN buttons to go up and down (in SSB its 2.5KHz steps - not much good in trying to listen for activity - I prefer the %)s 1KHz step). I suppose its just different.

- Using the 900 for the first time, I am not going to give ("I worked a station in Ulan Butor with a coat hanger and 100mw on AM voice just as soon as I turned it on") replies because they mean nothing. Suffice to say that the tramsmitter works great; great radios mean great receivers. Most tramsmitter as basically the same.

I plan to use the 900 in the car every day, as I have done with the 50S. I am daily on 14.280-14.290 at either 0620Z and 1600Z for about 10 minutes on the ride to and from work. If you want to try and meet me there you would be welcome. Then I would see how well the tranmitter works on a DX path.

I must admit that if the TS50S had the receiver of the 900 it would be the best radio ever. As it is, they are both good radios. I am glad I have them both (so does my credit card company).

Best,
Peter, KC1QF

Right now I need a new tuning knob for my FT-530, which I lost, and a new screw for my FT-411 for the chassis, which I lost. I look at all the documentation that I still have with these radios and they have addresses, but no numbers that I can call to order parts. Could someone give me their #? Or if they're on the Internet that's good, too.

Get ready for the annual sporadic E on 6 meters. No code Techs can work dx on 6 meters during band openings. December openings are already here.

I have a pristine Yaesu FT-650 , 100w SSB, FM , CW and 40w AM, with 6, 10, and 12 meter band capability. Continuous recieve from 24 - 54 Mhz.

Has power supply for 110v AC plus 12v DC.

Works great and has no problems. Easy to operate. New units retail for $1799, asking $1100 postpaid or best offer.

Return EMail to :
william@cortex.ama.ttuhsc.edu

OR call:

(806) 358-8331 during the day and leave a message that you are interested in the 6m rig and I will get back to you.

out
> of the car and into the trunk area.

I have the FT-900. I use it mobile and had a TS-50S. The FT-900 is, in
my opion, the very best mobile rig you can buy. Yes your friend is
correct in that you can not control some of the functions with the
control head remoted. Those functions should not be a problem for 95%
of the users. The functions are:
- No direct input of an operating frequency from the control pad.
- No direct bandswitching via this same pad.
- Mic-Gain control is lost. (some people think this is a BIG problem)
I think it is great. I never bump it now. It is always where it
was ment to be.
- Built-in electronic keyer on/off and speed are not available.
I do not run CW transmit from the car, not a problem for me.
I do copy CW from time to time though.
- Vox controls are on the back of the main unit so that is not
accessable. But this is never touched once it is set up and once
again I will not bump it.
- RF power output control is also lost. Why would I want to change it
from full output or a preset level for driving an amp. I don't..
- It is also not possible to change the AGC decay to fast. Again
except for maybe digital mode or CW why would you want to from the
mobile.

I have had many HF mobile rigs in the past 5 years.
Kenwood - TS-140S
Kenwood - TS-440S/AT
Kenwood - TS-50S
Icom - IC-725

Icom - IC-735
Yaesu - FT-890S/AT
Yaesu - FT-900AT

My favorite so far is the FT-900 followed close by the IC-735 then the FT-890. My gripe with the FT-900 is that it doesn't have the ability to control the attack point for the Noise-Blanker, and it doesn't have a real meter. The Kenwood TS-50S was just not for me, I found the receiver very prone to strong, near signal, overload... I mean really bad if you have the noise blanker on. The best noise blanker I found is on the Yaesu FT-890. That rig has no problem with srong signals near by, plus has the ability to adjust the attack point for the blanker. It just plan works!

: antenna tuner can't seem to find a match even into a dummy load. The dummy

Hummm.... My 767 is dead-on 1:1 into a Radio Shack dummy load without the tuner, and the tuner finds that as well. If you can't get 1:1 going directly to a perfect match, I'd say one of the two isn't right. Assuming an ohmmeter sees 50 ohms across your load, I'd say that there's something fried inside the rig. The indicated 1.5:1 probably is in error, and is a clue that the SWR sensing circuit is bad.

Good luck,

Greg KD6KGW

p.s. Your immediate problem not withstanding, it's a nice rig. Enjoy.

:
: I am somewhat confused by the statement about the RTTY and digital
: modes. I have been running digital on everything from an old tube
: Kenwood 820 to my new Omni VI. I had the Yaesu 757 GX (not newer
: GXII) and ran RTTY, Pactor, Amtor and HF Packet. I had absolutey
: no problems.. I ran a few of the RTTY contests and did very well.
: I was using a PK232
:
: Are you sure you have your rig and TNC connected correctly, and
: which TNC are you using. A shame to slam a nice rig like the 890.
:
:
: 73
:
: Jeff, AC4HF

Jeff

I have an 890 and love it but it is limited in the digital modes. The
reason for that is because you can't select the filters independent of
the mode (eg. the 500hz filter is only available in CW). To fix that
limitation I use a DSP and then there are no problems at all.

The FT-900 is the same radio with a different front panel, and has the
same filter/mode issues as the 890.

I did the mod to both of my FT-530's and I can enter frequencies at
12.5 khz increments! You should set the step according to the
~~~~
instructions on page 23 of your manual. If all else fails, you
could reset the radio's CPU, but this would erase all of your
memories, so be aware of this. This should help you. If not, give
Yaesu a call. Their tech support people are excellent!

Source record: 222107

This was my original post:

"Hello,
Has anyone here had problems with the Kenwood 732. I sent the radio back because the power output on the 2mtr side died. They had the radio for 2 days and sent it back after having, quote "Repaired APC circuits. Resoldered all joints and do corrective/preventive repairs on TRX unit and APC 023 protect mod. Full function test rx/tx GOOD. 2 mtrs po 50/12/5 Stable." unquote.

This seems to translate to "could not find the intermittent problem."

The radio worked for 3 days and now does not put out any power on the 2mtr side. It is back in the brown truck to Long Beach.
Have you had similar problems? Please let me know, I would like to suggest to the kenwood folks a plan of attack to fix this problem.

Please reply here or e-mail me. I may post your replys minus your name if you have a similar story to save the next ham radio brother (sister) a few UPS charges.
==========

I got some very interesting notes back, some defending Kenwood and some chastising them.
I was gona post some of the replys here but the bottom line as told to me by a local Kenwood repair shop is this.

Kenwood has cut the size of thier heat sinks by about 2/3.

They thought they could get away with using NO HEAT GREASE between the power modual and the sink. The thought here was "Nice machined surface on the heat sink, nice smooth service on the modules, no grease, save .002 per unit.

The problem is the module is cast not machined. This cost them an unknown amount in returns and repairs plus the bad publicity.

This is part of a reply I got back:

"Well, when Kenwood uses small heat-sinks and then forgets the no-brainer of putting thermal silicone/zinc-oxide on final power modules the suckas burn up. Obviously if you want Motorola or GE quality- guess what you buy... But on the other hand, I own 4 kenwood radios, and I've checked them all- not a spot of grease between the modules and the heatsink- so the sink stays cold and the module burns up. **HINT** rip off the cover and grease them up **NOW**!!

Another :

"I hope so. Between this whole mess, and the idiocy of their new HT (Th79) that
lacks a memory channel scan lockout feature, I have some doubts whether Kenwood
is really thinking about the Ham market, in any serious manner.

I know my next HT will probably be Yaesu. If it wasn't for the successful
741/742 - My Kenwood loyality in mobile transceivers would be lost also.

==========

The final word from the local repair shop is "get an amp and use low power
seting to talk simplex.
WONDERFUL, after spending $600.00 + on a radio you must also than spend
another $200.00 for an amp.

Does Kenwood really care about the ham business?

This will hopefully warn some of you who have out of warranty radios.

I am looking for a new repeater controller for a repeater that I work on. Our needs: interface to Motorola VHF Micors, digital voice recorder with several message slots, dtmf enable/disable from an ht/mobile or phone line, standard and reverse autopatch. Anyone who has had any positive results with a controller with these features please email me as this is one of those things that needs to happen yesterday. Thanks.

Source record: 222109

Why not start small and see how you actually like it?

A very few folks don't find the hobby as much fun as they anticipated and sell out. They always take a loss so keep your investment small until you get hooked bad or drop out. You'll cut any losses.

There is an active used market for ham gear. You can find darn near anything used. The Ham Station, Evansville IN even has it's own computer BBS with all it's Used Gear and prices (prices are negotiable). It is posted regularly on the node I am typing to you from here in KY.

Start with NO-CODE if you wish and see if you don't find yourself wanting to do more. Upgrade and buy the gear you need. Most people that buy in big time discover that they really invested big and that hurts the pocket book and it can strain family relationships too. Start small and make some good trades and buys. Build your shack slowly and it is not nearly so financially painful. Within 5 years you will have a bunch of junk (to sell) and some really nice stuff to play with. Sell everything every few years and invest that cash in better and newer stuff. I think you will find that most hams follow this kind of philosophy. Dealers give some nice deals at hamfests if you can just sell your stuff before those great deals get away. You can probably get by with a 10% show discount, and probably no sales tax (don't quote me on that <GRIN>) and no shipping if you take it home with you. Add those things up and you may be shocked at what you save.

With GATT up and running the tariffs are supposed to drop so watch and see if newer gear prices do drop some. Dollar/Yen parity have an impact on Japanese items. Manufacturers use small changes to gouge too just like gasoline wholesalers do so watch for falling prices with GATT and don't get suckered by the $/Yen changes. I ebt you already know that when parity allows for lower prices or, perhaps, GATT impacts and lowers prices the consumer price stays the same and the dealer adds accessories to try and offset the difference. Watch for items that have a lot of FREE ACCESSORIES going with them.

So there you have it. All you didn't want to know about getting into the
kingdom of HAM.

>Any comments on the Ten-Tec Scout 555, Pro and Con
>
>Thanks
>
>Eric, KC7CLE

Eric,
I've heard good things about it but you have to keep in mind that the purchase price includes only one band. It does have the capability to operate at 50 watts or 5 watts but at 50 watts it could really eat up a battery's power. If you're interested in qrp you might check out the Index qrp rig for about $1100.00 it gives you dual VFOs, and all bands including the WARC bands. BUT for the person who wants to get on the air and do so with a new (as opposed to used) rig it is a very appealing option. Let me know what you think about it if you get one! 73 de N7RAT

6437. how to clear a memory on FT530?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-14 16:02:17 UTC
From: kreifels@intel.com
Message-ID: <kreifels.787420937@fmwu23>
Source record: 222112

Does anyone out there know if there is a way to clear an individual memory location on an FT530? I know I can just write over it with another frequency, I can mark it to skip when scanning, or I can reset the radio and obliterate all the memories. But is there a way to wipe the contents of a single memory so it's blank?

Would appreciate any help here. TNX

Well gang I'm new to all this and just bought a KPC-3 TNC.
I NEVER wired up anything before and I'm sitting here wondering what the heck I'm supposed to do with these cables, etc.
Please be patient with me if you would. I've got an HTX-202 I want to hook up.

In the box is one gray cable with 6 wires in it, the wires are colored. I assume these go to the DB-9 connector. Which color goes to which pin? There's another cable (black) a 2 wire job with a plug on the end for my speaker jack I assume. Does the other end of the colored cable get connected to the black one and if so which wire goes where? My problem is what gets attached to where? I understand the icom diagram is the one I should follow (there's 2 types 2AT style or the W2A style which should I use?) but I just don't understand how to wire this stuff up. It looks like I'm going to have to buy a 0.1uf cap and a 3.9 ohm resister (I've heard to use a 2.2ohm?).

I'd appreciate any help I can get, I hope there are some patient folks who may be able to help me out here. It's frustrating haveing this thing and I can't use it! E-mail prefered to save bandwidth.

73,

Tom, KB2SMS

Boy, I wish they put my ft-530 through an environmental chamber. Two
weeks after I started to xmit with it the UHF side died (exciter output
only on transmit, very, very poor rceive sensitivity).

When I got it back from Yaesu it died again within an hour of use.

It's been OK since then, but it indicates lousy QC and lousier service.
Anyone want to buy a 530?

6449. Aligning Drake TR3 - 15 vs 80M?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-14 22:59:44 UTC
From: dgf@netcom.com
Message-ID: <dgfD0tp7K.M01@netcom.com>
Source record: 222123

An old TR3 found it's way to my house (amazing what happens when you leave a bowl of milk out on the back porch!!) recently. In realigning it, I've been unable to get it to work properly on both 15 & 80 meters at a common setting of the various tuning slugs. I think it shares the same slugs (with two variable caps) between these two bands. I've followed the alignment procedure, and the result is I can get max out on 80 & 15M of about 100 watts, while on 40 & 20 I get over 175 watts, and on 10 I get about 140 watts. If I favor 15, I get 175 out on 15 but nothing to speak of on 80; if I favor 80, I get 100-150 out on 80 but nothing to speak of on 15. RX sensitivity tracks (that is, it is good or bad) the TX output. All tubes seem good, and otherwise it's ok. Comments? 73 Dave WB0GAZ dgf@netcom.com

6450. FYI: Fixing dead Bird 43 slug

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-15 00:09:34 UTC
From: dgf@netcom.com
Message-ID: <dgfD0tsFz.6rG@netcom.com>
Source record: 222125

[If anyone thinks this should be added to the various mod-servers out there, please feel free, but let either of us know where it's been posted so we can submit correction! This is the first posting of this message, on 14-Dec-94, so it is subject to update.]

DEAD SLUG

Dead Bird slug? Bird says buy a new one. Gordon (WA9SLU) and Dave (WB0GAZ) say try to fix it, but remember, you're already working on a dead slug, so there's nothing to lose and no guarantees!!!

Tools: You'll need a small flat-blade screwdriver, about 1/10" sharp end (like in a Radio Shack screwdriver kit), a medium-sized flat-blade screwdriver, a pair of pliers, a soldering iron, an ohm-meter, a small vise, a couple of small rags, and (for testing and recalibration) a working Bird meter and appropriate slug. If you haven't done one of the slugs before, I'd also suggest a pad of paper, a pencil (to take notes and make sketches during disassembly), and perhaps an instant camera (if you really want to remember how things looked before the butchery began!)

Important: As usual, please read the whole write-up before proceeding - it really helps to know what you may be up against before getting out the oxy-acetylene torch... Also, this note was compiled on 14-Dec-94, and has not been extensively reviewed, so there may be errors or unforseen circumstances.

Other note: There are no really tiny parts in any of the slugs I've seen so far, but if you're not comfortable replacing or adjusting the small screws in a pair of eyeglasses, you may find working on the slug frustrating.

Input gratefully accepted, to dgf@netcom.com or glsmith@koess1.delcoelect.com

1. Does your slug's metal label have two small pins in it that look like rivets, but are about 2mm diameter? If so, these need to be removed first (the fasteners are about 1/4" long and friction-fit into the slug's body). As they have a smooth top and no easy way of removing, you can proceed to step 2 if you can't get them out.

2. Hold the slug in a vise (be careful the two electrical contacts, and don't squeeze hard enough to distort the cylinder), label plate up. Use a small screwdriver (I used a jeweler's screwdriver with about a 1/10" wide end) to pry away the metal label plate. If there are no pins (item 1 above), the plate is held in place by a tacky glue. If there are pins, only the pins hold the plate in place. If you can't get the screwdriver under the edge of the label plate, try hitting the end of your jeweler's screwdriver with a pair of pliers or something else to dig a bit deeper into the gap between the plate and the body. You may need to pry up in a few places. Try to be careful

to preserve the plate's cosmetics (Bird won't sell you a new one). If you bend the plate, don't worry - just put it between two flat pieces of metal, put the sandwhich into a vise, and squish. If you have the pin-style attachment (as item #1 above) and you didn't remove the pins, you need to pull HARD on the label plate to start the pull-out the two pins, then as soon as the pins are a bit loose, grab onto the end of the pins with needle-nose, and pull out while twisting. Remember, a bent plate is not the end of the world. Save the pins. If you've worked with JONES PLUGS you know what kind of pin I'm talking about.

3. You MAY see a small trimpot thru an access hole near the large center assembly screw. The access hole would be about 1/8" diameter. An observed failure mode is poor operation of the trimpot (intermittent). Put the slug into a meter, and attempt adjustment of the trimpot. Remember if you play with the trimpot you'll lose calibration and will need an independent way of re-establishing calibration. Replacing the pot with different one may be necessary. Replacing the pot with different value may give method of changing the slug's operating range (I don't suggest this, but it's possible...)
If adjusting the pot fixed things, then you might want to quit while you're ahead, and proceed to step 12, then step 14, for reassembly. If you don't feel comfortable with this fix or it didn't work, proceed with the next step. By the way, the trimpots I've seen are pretty common looking.

4. Got this far? Unscrew the large center screw and lift away the cover plate it's holding in place. Unsolder the trimpot or bend it's leads to remove out of the way (if not a pot, perhaps another calibrated resistor; in any event there is a screw under the pot/resistor you need to get to). If a pot is present, there may be a small piece of fish-paper (insulating grey paper) under the pot. Remove it (just sits in place, probably no glue). Now you will see two small screws (recessed). Remove them. They may be rather long (some older styles use these screws to hold the back white teflon cover in place; other screws are shorter and just hold the electronics to the slug body).

5. If the two recessed screws were about 1/2" long, the back teflon cover may come off on it's own. Set it aside.

6. You may be able to pull the electronics out (use needle nose pliers and handle with care) now. If successful, proceed to step 8.

7. You may need to remove the teflon cover for access to the back of the electronics module. If it didn't come off by now, you need to pull it off. This is difficult and you can't avoid denting the slug cover. I used a pair of slip-joint pliers, padded with a rag. The cover was friction-fit into the end of the slug body; the friction-fit depth is about 2mm. It is possible to destroy the cover; really be careful! Presuming you got the cover off, remove the electronics module.

8. Now you have the electronics module free from the body. Inspect for loose metal (I have found this in one of my slugs - it was rattling around; Gordon WA9SLU reports finding a metal thread shorting out the diode, and the thread was easily removed, altho before finding the thread, the diode looked bad).

9. Check the diode (use an ohm-meter). If the diode is dead, it will need to be replaced but I have no idea what kind is needed. Reheat solder joints (there are about a half dozen solder joints, one might be intermittent.) Be careful when re-heating solder joints not to disturb the geometry of the parts on the module. Possible that other parts have failed, but mostly they are resistors and bypass caps and unlikely culprits.

10. Reassemble, in reverse order of disassembly, EXCEPT if your slug has the press-fit teflon insulator, leave that off for now. Also, don't replace the label plate yet. As you reassemble things, be careful to see that there is an orienting pin that MUST be respected (that is, there's only one way to fit the module back into the slug body before you screw anything down). Also, if you have the screw-retained teflon insulator (with the two long screws), you need to use the insulator at this point because it's what the screws attach to. You should have the two small retaining screws back in place now. Finally, before you replace the big screw, make sure you've replaced the small insulating fishpaper under the pot's leads (if there was same in your slug), CAREFULLY reposition the pot, and note that the body of the pot needs to line up with a hollowed-out area in the screwed-on cover (where the access hole was found). Look things over carefully before you apply any significant torque to the big screw. Be particularly wary of the pot's (or other parts in this area) leads shorting against the body.

11. Install, test, and re-calibrate as needed. If slug is still dead, you're on your own (but let either of us know how you fixed it or what you found!!)

12. Replace label plate. OBSERVE POSITION, THERE IS ONLY ONE POSITION THAT IS CORRECT!!!!!! Push pins back in if this was the attachment method, otherwise, use a NON-hardening glue SPARINGLY in case you need to re-open the slug in the future. I suggest NOT using RTV, but rather a glue intended for subsequent removal, such as that used for holding sandpaper discs onto a power sander. My glued-on plate stayed in place just by pushing it back against the glue residue that was already there.

13. Re-install teflon insulator cap if it's the press-on type. This is unfortunately no easier than removal. It likes to wedge itself into place "off angle". Just proceed slowly, and use a DULL end-tipped instrument to press into place where it's not going willingly. Very easy to puncture... There is a reason this is step number 13!!!

14. As WA9SLU says:

"I'm sure my plastic cover has the same dent yours has.
Consider it a "badge of honor"....wear it proudly....
the few, the proud, the Bird slug repairers!"

73,

Dave WB0GAZ dgf@netcom.com (and now the owner of an extra 50H slug...)

I have a GE Master Pro that I would like to put on the 6 meter ham band. I was wondering if anyone out there might have a manual for one of these so I can do the tuning and hooking up of the cables. The only things that I am missing are the mike and speaker which I am hoping I can rig up something. Any help would be great....

Thanks,

Greg Pallotta KC1TE

Tune to the memory location you want to mask, hold FM until the
memory number blinks, the press SKIP. This will wipe out the memory
- it can no longer be accessed or scanned.

Try removing any sound driver that uses the built in speaker. This
driver causes problems with the Windows Com drivers. I have seen many
FT-1000Ds' work with LogWindows Ver 1.0 and 2.0 and the only problem has
been when the driver was installed.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.swap

I'm looking for mods for Standard HTs, the C1xx models. I've seen mods around for C5xx and above, but don't seem to find any for the 'simplier' models.

Preferably, for the C150. It's very similar to the C158A, but this unit has no out of band rec (I believe it's only 144-148 or something like that). Or a service manual for this model.

Would appericiate pointers, ftp sites, etc. Please reply via email.

Thanks.

From: levine@mc.com (Bob Levine)
Subject: Yaesu FT-900. comments anyone?

< letter omitted>

Sir;

You recently commented on *rec.radio.amateur.equipment* about the new mobile HF rigs TS-50 and FT-900. I also am looking for a HF rig that I can remote the control head for mobile application. My financial situation is hard pressed to purchase either, so I'm considering a FT-747. Would I be settling for a disappointing radio? I realize the remote kit is about $200 if purchased separately so I hope to find a used one that has this cable.

Thx for your input to the newsgroup and your response to this letter.

DAVID>>Clint: Do you have any other Standard equipment?

Just the C588A (220-only) unit and accessories. It fills a requirement I have in my area for repeater use - and it does it excellently!

Excellent support from the COmpany, too. Couldn't be more pleased with a purchase than I am with my Standard equipment.

6462. TH-79 Mod Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-15 15:05:52 UTC
From: kab@norman.NO
Message-ID: <9412151605.aa26395@norman.norman.no>
Source record: 222136

Re. the mod variations on the TH-79: Talking from experiences with ICOM,
I know that software is often reshuffled in these radios. One thing that I
observed: If you're going to open the bands with the standard mod involving
removel of two of the diodes, do NOT cut the green wire. The green-wire
option seems to be achieved with the two-diode mod, while removing the
diodes and curtting the green wire will give you some variant of limited
european coverage.
I wish there were a complete tech manual on this - sigh!

This is to inform you of what seems to be a discrepancy between a message from
your system and the currently accepted specifications for echo mail.

Because the message appeared to be grunged, or a dupe, it was deleted in order
to protect the rest of the echo mail distribution system. This copy is sent
to you for information purposes, to help you find the source of the problem
and fix it.

If you are running Gecho 1.10, please obtain the 1.11 fix at your
registration site. 1.10 has a bug in it that grunges the headers and causes
problems with some other mail tossers.

The discrepancy noted in the message, as received here, was:

1) The number of ORIGIN lines (2) exceeds the maximum of 1.

The message was in the RADIO.AMTR.EQUIPMENT area.

With that list above, I would go for whatever rig you find in it for less than 500 bucks!....I personally can vouch for the Kenwood TS140 (I own a 680 which is the 140 with 6mtr added)...but the 430 rcvr is slightly better in performance....The ICOMS are Yaesus are no slouches either...

Go for whatever you can afford..

If one does what was posted (example: mem loc 2) this location will be removed
from selection and scanning. However, holding the FM button until it
blinks and then turning the selection knob to mem loc 2 and hitting
the skip will bring it back with everything intact. I read it as
somehow leaving the location but have nothing in it. What you suggest
will have that effect, but one still get back the old saved setting if
desired.

6475. Modifying the Yaesu FT-5100 microphone...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-16 07:15:35 UTC
From: justinb@psg.com
Message-ID: <1994Dec16.071535.21345@psg.com>
Source record: 221998

I recently purchased the Yaesu FT-5100. It comes standard with the MH-27 mic. I want to get the mic to turn on the red LED when the PTT is presseed. I see that the pin diagram of the unit has a +5 volt line from the radio. I believe I could some how hook up the same LED as supped in parallel with the PTT switch inside the mic. I would also like to have a small speaker in the mic to hear the conversation more easily. Of course I could shave out a hole for a new LED and possibly SQUEEZE in a speaker, but how can I do this WITHOUT digging or breaking internal parts??? I know one other option would be to just make my own box and hook up the speaker, mic, LED, PTT switch, possibly UP&DWN, and MAYBE with some MAJOR luck the DTMF also, OH and the lock switch...BUT that would take some major work and time to get everything right...and probably wouldn't work perfect... Should I just buy MH-26E8, speaker/mic <without DTMF); >

Some reasons for this mod would be to know if you dropped the PTT on accident, and to hear the outt in noisy situations...well who knows I could hook up a 5k pot to the speaker and have a volume knob... hmm think about it...it should work for most mobile units, right?

Well, please let me know if you have any suggestions or comments. Either reply here or via email...

Thanks a MILLION!!

>Eric, KC7CLE

Basically it is a nice compact rig with reasonable power.
I have one for portable operation, (from the car with wire
or vert. antenna). And it is one of the cheapest rigs on the market.
Overall it is well and functionally designed and the total absence
of unneccesary buttoms is a real treat.
Selectivity of the receiver is good due to the low sideband
noise of the LO.

Now to the cons:
the filter is not quite as good as a fully blown crystal filter with
respect to skirt steepness, and there is some whine on the audio,
which takes getting used to. The frequency is well stabilized,
but you have to get used to the way how the tuning knob operates:
when you turn it, the controll loop unlocks, the frequency can be ad-
justed and after being left for a second the loop locks again.

FT-1000s with roms earlier than version 6.00 send ALL their information when polled via the CAT port. A change was made in 6.00 to allow requests of single pieces of info (ie just frequency). Last I heard Yaesu would send you a new ROM for free. Do the Las Vegas Display Test (see manual) to see which version of the rom you have.

TOM>>...bought a KPC-3 TNC.

Here's the TNC hook up for the Radio Shack 2m HT:

```
TNC Radio
=== =====

Audio Out -----------||-------------- Tip of Mic plug
C1 |
|
PTT Line ----\/\/\/--------| Ring of Mic (not connected)
R1

Audio In --------------------------- Tip of speaker plug

Ground ---------------------------- Ring of Speaker plug
```

C1 is a 0.1 mfd capacitor of any type, R1 is 2200 ohms.

Nice review, Peter, but you didn't answer the important question. How
do the two rigs stack up against the benchmark mobile HF rig, the IC735?

Gary

Source record: 222005

I am in dire need of a mobile mount for a Yaesu FT227R memorizer.

I have seen many of these radios at recent swap meets, but none of them had the mobile mount with them. Where did they all go ? Do they self destruct after 8 years ??

If you have one in your junk box, or hell, if it even has a radio attached, I would definately like to trade $$$ for it.

Please reply via e-mail or phone

I have seen information as to the required changes of
wire bridges at the processor on Packet. May be you find
information in an FTP server storing the ARRL files, they have lots
on rig-mods. Then you could see it on the unit you have taken out.

6490. Kenwood fixs major flaw w/ new 79a model D

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-16 19:02:10 UTC
From: Brad@enivri.irvine.ca.us
Message-ID: <3cso7i$9ck@news.service.uci.edu>
Source record: 222012

Kenwood annouced this week it is upgrading the TH-79a w/
a new model the TH-79 model D.

Maybe the "D" stands for dumb because thats what Keenwood did
when it released the 79a with the worlds bigest design flaw; no
memory channel lockout. You want to scan....to bad.. you have to
scan every memory channel.

After saying they wouldn't be updating it or fixing the problem
Kenwood just did a major screw up by offering great discounts to
dealers across the country in time for Christmas. Now that the
dealers are all stocked up on 79a's Kenwood announces the "new"
model 79d. I bet there's some pretty ticked off dealers out there
with lots of 79a's all stocked up and once the word gets out no one
will want them. Pretty rotten of Kenwood.

Somehow I think if they had hams on there design team this wouldn't
of happend. The new model is scheduled to be shipping after Christmas.
Good timing.

Maybe a Yaesu 530 is a better choice for that present under the tree
this Christmas.

Happy Hollidays to all.

Brad
A 4 time Yaesu owner.

6495. Knwd TS-50 VS TenTec Scout

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-16 23:51:36 UTC
From: morawski@starbase.azrael.mitre.org
Message-ID: <MORAWSKI.94Dec16185136@starbase.azrael.mitre.org>
Source record: 222017

I recently had the privilege of borrowing a TS-50 for a weekend. I was considering a TS-50 to replace my Ten Tec Scout, and I operated the two side by side for several days, with an antenna switch to facilitate quick comparisons. I operated CW only.

Of course, the TS-50 has LOTS more features, and you pay for them. I was surprised to find the receiver in the Scout to be superior--quieter and more sensitive. And the Scout's QSK was clearly superior. The tuning on the TS-50 was MUCH better for two reasons. First, they chose a much slower ratio, and second the Scout has a PTO which is sensitive to stress on the tuning knob, etc.

The TS-50 had no narrow filter, so the Scout's Jones Filter made the Scout much more useful in crowded situations.

When the weekend was over I had a renewed appreciation for the Scout. Although, I am still considering replacing it with a TS-50. My main gripe with the Scout is a slight drift during CW operation. Several stations have commented about it on the air.

Hope this info is of use,

Paul Morawski, AA3DD

They have been around quit a while so won't cash your check and run.
However I have heard a couple of stories from people on
rec.radio.scanner about purchasing scanners that were supposedly
cellular modifiable/restorable (they specifically requested this), but
then received the new non-restorable models. Mainly the PRO-43.

>looks pretty difficult.
>

This all depends upon what you are trying to do and what frequency range you are desiring to end up in. You may be able to get away with realigning for the 147 Mhz range and up. But to be moving much below that is asking for trouble and instability to move in.

The first issue here is the receiver. I recommend doing a proper conversion of the receiver which consists of changing five capactors and replacing the front end helical assembly. The capactors are cheap and the front end is not that expensive either. The last time I priced one it was in the $35.00 or so range. Look at the front end and you will see a number ink stenciled on it that goes something like this: 1V80775B66. That is not the correct number but look and you will find it. Get yourself a front end that ends with a part number of "65". That is the proper part number for the 142-150 Mhz range front end. The part numbers for the capactors are called out in the manual and can be found in the receiver parts section and what you are looking for is the capactors with a "M" after the callout on the print. For example, C101M is a part for the range 2 or middle range which just happens to be the 142-150 range. Read the manual, change the parts and you are all set for receive to order your channel elements. Two other things: 1) Don't be tempted by those who say they can just put in longer screws to make your front end come into range. This does not work well. Also, don't bother trying to order out the coils for the front end and try changing them yourself. It is n not worth the effort and the agony of trying to heat up that front end with a pair of BIG soldering irons or a torch. Save yourself the trouble and buy a front end. Those who say they have rewound or changed those coils have most likely not soldered the coils in correctly and have problems with intermittant front ends. It is not worth the hassle, just buy it. 2) How to get the thing on channel. Your best bet is to get channel elements through a place called "Channel Element Headquarters" in Cincinatti. Their number is 800-237 9654. Tell them you want channel elements for a Micor, with HIGH SIDE INJECTION. That is important. They should stock just about any channel you could want. If that does not work, go with International Crystal in Oklahoma

City. Their number is 800 426 9825. They will custom cut a channel element and temperature compensate an element for proper results. DO NOT ATTEMPT TO RECRYSTAL CHANNEL ELEMENTS YOURSELF AS YOUWILL NOT BSURE THEY WILL STAY ON FREQUENCY. (And for those who say they do and have gotten good results, blah blah blah, tell me another one. How many times have you HONESTLY had to set your radio back on frequency? Also, how far was it off?) Recrystalling is tempting, but don't do it.

Now the transmitter. Converting an exciter to range one is not that big of a job. What you have to do is go through the manual and make parts list just like te receiver. This time you are looking for all the C101L type numbers where the "L" is the range one indication. You will end up changing 13 or so capactors. Not a bit job. I think an inductor or two also ay be necessary to change. Anyway, you get the drift.

Filters and power amps are a totally different topic. If this radio is a 110 watt version and you are trying to bring it down to the 146 range, you may have some stability problems. The tuning of the power amp is a bit touchy and the range, that is how far out it spreads, may be really tight on the ends. The two tuning capactors on this power amp make a BIG difference in current draw in the final stage, but not a HUGE difference in power out. The translation of this is, you really need a test set and a Micor cable in order to tune this radio properly. If you read the manual, all this stuff is called out and shown in neat little pictures of how to hook it up and everything. A portable test set is not that expensive. I have seen them at hamfests for $20.00 to $50.00. Sometimes the cables are included.

Back to the power amp. Depending upon your application, such as a fixed station for packet, I would certainly think about replacing the power amp board with one of the proper range. For best long term results and stability that is the best way to go about it. That is also a bit pricy, as the powr amp board is around $150.00 or so. You should also replace the filters, the exciter filter and power amp filter to make for a proper match and keep any other undesired harmonics under control. The filters are about $30.00 or so new, but you can probably find them in the loose parts piles at a major ham fest at a radio dealer's table. Know your part numbers. You probably have TFD6112 and TFD6102 in place now. You want the TFD6111 and TFD6101 types.

I guess this comes back to your application. What do you want to do with the radio? How much money do you want to spend on channel elements and how many channels do you want to equip? Is is going in your car or home? What range do you wish to cover and how far apart are the channels?

Think about all this before you begin and make sure the radio will do what you want it to and at a reasonable cost.

Beware those who say, "Tune this, tweak that and PRESTO! you are on the air." Nine times out of ten they have no idea what they are talking about and have torched many pieces of equipment in their careers needlessly.

If there is any other help I can offer, drop me a line.

I'm selling my station full of great equipment in pristine condition. Its centered around a Kenwood TS850S/AT and a Heath HL2200 linear, the last of Heath's big guns. Also available are Heil mics, 2 meter rigs and Alinco DJ160, and lots of other stuff. If you are interested in a more complete list E-Mail me and I will send it ASAP. Prices are not bargain basement but are reasonable. 73's

This is to inform you of what seems to be a discrepancy between a message from
your system and the currently accepted specifications for echo mail.

Because the message appeared to be grunged, or a dupe, it was deleted in order
to protect the rest of the echo mail distribution system. This copy is sent
to you for information purposes, to help you find the source of the problem
and fix it.

If you are running Gecho 1.10, please obtain the 1.11 fix at your
registration site. 1.10 has a bug in it that grunges the headers and causes
problems with some other mail tossers.

The discrepancy noted in the message, as received here, was:

1) The number of ORIGIN lines (2) exceeds the maximum of 1.

The message was in the RADIO.AMTR.EQUIPMENT area.

6514. UK First! 2nd User Equipment Directory Online Now!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-17 16:24:03 UTC
From: Mike@g4kfk.demon.co.uk
Message-ID: <787681443snz@g4kfk.demon.co.uk>
Source record: 222038

The CQ Centre BBS is pleased to announce a (we think) UK first!

We're bringing together 2nd user equipment listings from a number of UK Amateur Radio Equipment Retailers, to be made available in the following formats:

1/ Online Viewing - at The CQ Centre BBS (details below)

2/ Downloading - from file area 12 of The CQ Centre BBS

3/ Fidonet File Request (FREQing) with the following 'magic' file names:
HFRX for a list of HF Receivers
HFTX for a list of HF Transmitters and Transceivers
MOBILES for a list of VHF/UHF Mobile Transceivers
VHFBASE for a list of VHF/UHF Base Transceivers
HANDIES for a list of Transportable and Handheld Transceivers
SCANNERS for a list of Airband, Marine and Scanning Receivers
DATACOMS for a list of Packet Radio & RTTY Equipment
ACCESS for a list of Station Accessories

The IEMSI server for file requests is on 01753 595468

4/ Email request to mike@g4kfk.demon.co.uk - I'll normally respond within 24 hours, often a lot quicker during weekdays.

We've kicked off as of today with approximately 10 mobile VHF/UHF rigs, 38 handheld transceivers, 23 hf receivers, 13 hf transceivers and 30 scanning receivers.

Access to the list is (of course) free.

Happy bargain hunting!

73
Mike

6515. AUTO ID'ers FOR SALE. WORK GREAT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-17 16:34:56 UTC
From: ko4ta@mindspring.com
Message-ID: <ko4ta.38.00A2B219@mindspring.com>
Source record: 221956

You know I hate it when you have to keep up with the time to ID on the radio. The FCC requires that we ID every 10 minutes and at the end of the transmission. Well I hate to admit it but I probably have missed an ID or two. Not any more though with my K4DPK ID'er. I purchase an automatic IDer from Phil Chamblee in Rome, Ga.

This thing comes in a package about the size of a pack of cigarettes. It connects to the rig and will either work on VOX or PTT. You can record an audio message in the DVR circuit and it will play that audio message every 10 minutes or whatever time you set it to. It is really slick.

Now if I want to I can set it to just buzz every 10 minutes and I can do my own ID. I think this thing is really swift. As I attempted to build one and found it alot more difficult that I had supposed. I used over 30 dollars worth of parts and never really came up with what I wanted.

Phil Chambley K4DPK is a amateur radio operator who had heart surgery a few years back that went really bad. He is now retired and doing pretty well physically. However he will never be able to work a regular job again.

This post is not intended to be a commercial message. It is simply an attempt to help two groups of people. The people looking for an Id'er and the guy I know who sells a really good one and can supply the need.

I am in no way affiliated with Phil Chamblee other than a guy he has helped with several projects. I consider him my friend as I hope he does me. Please if you call him be nice. Tell him you saw this post.

His name is :

Phil Chambley

From: mike@sccsi.com
Message-ID: <mike.8.0012499B@sccsi.com>
Source record: 221968

I need to talk with someone who is using the AEA LogWindows software and the Yaesu FT 1000D. I continue to have problems with the software not obtaining the frequency or the mode from the transceiver even though the CAT system light comes on.

I am using a J-COMM interface which works well with CT, DXBASE, and LogicWindows. The version of the FT 1000D ROM is Version 6.0. There is no file under Widows named SPKR.DRV and Yaesu states that the 2.7 K resistor from pin 2 to pin 1 does not work with this rig.

Maybe someone out there with the same setup as me can enlighten me as to what I am doing wrong since the software does work with the 1000D according to others.

Mike, K5HDU.....mike@sccsi.com

6520. Cushcraft AP8A Radial Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-17 18:41:56 UTC
From: nordlund@teleport.com
Message-ID: <nordlund.4.0012B37A@teleport.com>
Source record: 221950

I am looking for some words of wisdom concerning radials before I put up my AP8A. I have a large spool of wire and insulators so I was planning on making the radials myself. From the catalog information on the available radial kit (APR18A) they claim that the longest radial is only 31 feet. This would seem to only cover down to 40 meters:

Question 1: Are they saying you can operate on 80 meters with 31 foot radials or do the instructions with the radial kit tell you to add some 65 foot radials to those provided?

Drawings in the antenna manual seem to show that the radial kit is made up of 3 sets, made of two short single conductors and 1 longer (31 foot?) multi-conductor radial.

Question 2: Which bands are covered by the two separate conductors?

Question 3: Why couldn't the separate conductors just be part of the multi-conductor set (to ease the installation)?

Answers can be posted (if this is the appropriate group) or you can mail me at nordlund@teleport.com

Thanks. Brian

Cross-posted to:
mit.bboard,ne.forsale,alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.swap,rec.radio.amateur.misc,rec.ham-radio

I'd much prefer to sell these locally, to avoid hassles & delays from
mailing the items. Local means Boston area.

For Sale:

1) Icom IC-2SRA handheld transceiver $400
- receives 25-950 MHz
- includes cellular range (unmodded)
- transmits 2 meter band (140-150 MHz)
- transmit strength .5, 1.5, 3.5, 5 W
- AM/FM/WFM bands
- 63 memory locations
- 9 hour continuous use (scan mode) battery
- includes manual, schematics
- AC adapter (standard type) not included

2) Radio Shack Pro-37 handheld scanner $150
- receives 30-54, 108-174, 380-512, 806-823, 851-960 MHz
- includes cellular range (modded)
- 200 memory locations
- takes 6 AA batteries, built-in recharger
- includes manual
- AC adapter (standard type) not included

E-mail me with a phone number if you're interested in either one.

-tdk

6533. Re: Cushcraft AP8A Radial Questions

Newsgroup: rec.radio.amateur.equipment

From: doughall@nando.net
Message-ID: <3d0egt$ik5@merlin.nando.net>
Source record: 221961

If you're ground mounting the AP8A then the radials don't have to be a particular length - and a good rule of thumb is that they need not be any longer than the antenna is high. Also, lots of short radials are generally better than a few long ones. This changes when the antenna is elevated, and then the radials must be resonant. You didn't say whether you were going to ground-mount the antenna or elevate it, but I'd personally recommend ground mounting.

Yes, I know. The harmonizer. The thing is, the best way to go pirate is tto know exactly what the FCC Rules & Regs are, and have a good background in basic theory. You can then find a way to go around the rules. Of course, if you really don't care about the rules, and want to go really pirate, then you'll still be better off with a base in theory.

But, the simple way: There are companies that make FM transmitters with stereo RCA inputs, and have the maximum unlicensed output: 200mW. Ramesy Electronics makes one of these, called the FM-10. Its frequency stability is a little off, but for these purposes you're not gonna really care about that (it can be fixed with the addition of a regulated power supply and the replacement of a capacitor). Anyway, it operates from a 9V battery.

So now you've got your transmitter, but only enough power to reach your front door. Like Tim Allen, you need MORE POWER! Well, there's a little doohickey called a linear amplifier. They're usually built for amateur radio use, so they have the broadcast bands disabled in circuitry. Plus most only have a certain effective frequency range, anyway. So find one that has VHF circuitry, and take it to your workbench, and proceed to remove the "governor." Hook the trans to the amp (which then makes the trans the "modulator," and the amp the effective transmitter), and let fly.

Note: specific information not provided, even if you ask me for it. I don't really feel like being visited by a letter from my local engineering station. I'm only giving basic principles, so as not to get in trouble for whatever you might do with this information.

Specific information categories: how to disable the lockouts in the amp, how to hook up the FM-10 to the amp, how to construct an aerial.

One more thing: unless you know theory (again with the theory stuff) there's pretty much no way you'll be able to do this from RS (Radio Shack) parts. And if you know that much theory, you oughta know how to do this anyway.

6538. Opinions on DSP audio filters & pwr supplies?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-18 17:54:43 UTC
From: mcolosia@achilles.ctd.anl.gov
Message-ID: <3d1t13$p01@milo.mcs.anl.gov>
Source record: 221963
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

Scenario: SWL'ng, monitoring SSB, and copying CW off of a Drake R8 using
an indoor dipole. Unable to pull weak stations out of the noise,
I'm going to purchase a DSP audio filter. Since the filter requires
DC, I might as well power the R8 off the regulated supply also. It
should filter out some of the more obnoxious AC noise.

Considering: JPS NIR-10 (I previously owned one using a Paragon)
Timewave DSP-9+ or a DSP-59+
(I'm currently trying the rat shack DSP unit, it does
a nice job for what it is; but, I need a more flexible unit.)

Astron RS-12A at 9 amps cont. (no meter); OR, a
Daiwa PS120M at 9.2 amps cont.

I'm leaning toward the Timewave products, specifically the 59+.
The Timewave is more current, and offers more tuning steps than the JPS'.
(Any preferences toward the 9+ over the 59+ out in net land?)

As far as mains, the meter on the Daiwa is nice, but DC connections for
several units appears easier on the Astron. Which brand (unit) offers
better reliability and filtering?

thanks in advance,

> pwalker@mbi.moody.edu

I owned a TS-520 back in the late 70s, early 80s, and I found it to be a very good rig. Mine did have a problem with RF on 15m getting into the audio section and locking up the VOX if I was using it, or leaving residual charges in the AGC on key-up causing the S-meter to bang over when going back to receive, but that was the only problem I had. All other bands were fine.
The only thing I found annoying (which they fixed in the 520S) was the meter switch was on the same knob as one of the xmtr tuning controls, and you had to hold the control still while changing the meter function or you would detune yourself.
All in all, it was a very good radio. For CW, it was very good with the 400hz filter on receive, but I'm not a semi QSK person. I prefer full QSK.

My two milliwatts worth...

Hi Dave,

Have you thought of phoning ICOM (UK) and asking the Amateur Sales Director
(Dennis Goodwin G4SOT) how to reprogram this? He is quite helpful (in Kent
at least) to amateurs using ICOM kit for non-professional uses, even if it
was designed for professional use.

The switchboard no. is 01227 741741 (ICOM's Herne Bay offices)
The shop no. is 01227 741555

Hope this helps.

73, Paul

> or reference on the output coding.
>
> Thanks,
>
> bart wb6hqk
>
> bart@wb6hqk.ampr.org
>

It's a BCD output as follows:

Band	A	B	C	D
1.8	1	0	0	0
3.5	0	1	0	0
7	1	1	0	0
10	0	0	1	0
14	1	0	1	0
18	0	1	1	0
21	1	1	1	0
24	0	0	0	1
28	1	0	0	1
29	0	1	0	1

The 7442 TTL BCD to decimal converter works nicely as the controller for
an interface to automatically switch antennas. There's one commerically
available from Top Ten Deivces in Phoenixville, PA

If anyone has info on the DVS jack outputs on the FT1000, I'd appreciate
info.

I'm becoming interested in collecting and restoring old ham equipment (military also considered) that was manufactured in countries other than the US from the period of 1930 to, say, the mid-1970's. Prefer equipment for which tubes are still available.

Any information on sources of equipment, catalogs, manuals, amateur publications, etc. would be appreciated.

[Posted on Sun, 18 Dec 1994 22:58:27 GMT]

I have some HAM stuff and more for trade or sale. Please make offers if
interested in anything. I'm interested in everything...

-ICOM 24AT Dualband HT
-ICOM 45A 440 mobile. 5 memories/2 VFO's
-YAESU FT470 Dualband HT
-YAESU FT411 2M HT
-6M GONSET 150 watt base/tube amplifier
-VHF car stereo antenna mobile matcher
-6M Mobile SSB halo/ring Antenna. 2' diameter x 4" tall/wide
-Antron 99 10M base vertical with groundplanes
-AVANTI Mobile Moonraker 6' Magnet Mount 10M/CB mobile antenna
-Hy-GAIN 2M mobile trunk lip 5/8 wave
-ALLIANCE HD73 antenna rotor with controller and cable
-MFJ 1270 HF/VHF TNC
-MFJ 1278 Multimode TNC
-DATOTEK DNV-630 Military Voice/Data Scramble Units. Manual/cables included
8 code entry buttons, 8 code memories, option selector switch, clear
channel monitor, code tamper-proof...

-Standard military green mobile-mount/base configuration
-Standard military tan portable/man-pack battery configuration
-Conventional suitcase/acoustic couplers telephone configuration

-B&K Dyna-Quick Model 650 tube/transistor tester w/cross reference guide
-RF test generator... 1-30MHZ. Solid State.
-SONY date/time logging portable tape recorder with VOX
Great for scanner logger. Uses regular cassette tapes
-PANASONIC Transportable Cellular Telephone. Good shape.
-Small 24V 1/2 amp power supplies
-HEATHKIT 100KHZ portable sine/square wave audio generator
-TANDY CT-350 "Nokia 121 clone" handheld cellular phone
-Parasound AWM-360 6" White Monitor Speakers with brackets in box
-Parasound AWM-380 8" White Monitor Speakers with brackets in box
-2 Commercial 56K baud voice/data multiplexing modems
-KICKER Substation 80 8" woofer box
-2 Unused 8" 8ohm Woofers in original box.
-Radio Shack 40 ch. CB walkie talkies
-MAXON 40 ch. CB walkie talkies
-Johnson Control DYNASTY GC12800 Gell Cell batteries. 12V 80AH Storage cells.
-Internal PC Battery UPS. Takes half-height drive bay and motherboard slot

-DAYTON electric high-pressure "car wash type" water/soap sprayer
-Miscellaneous regular/cordless telephones and accessories
-LOTS of PC software/hardware

Terry

I have been using a TS-850 for about a year and a half now. In short I love it! Lots of things I like. Only small irritation is the RIT/XIT only moves +/- 1.25KHZ. Never looked at using a transverter with it but does not appear right off that it is set up for this like it predecesors. I owned 2 TS930's b4 i bought this rig and they were definitely set up for it. It is not obvious to me that tyhis rig is from reading the manual. Has great memory features plus the interface to the PC is great for contests, plus I use DXBase to log with and much of the freq and mode data is passed directly from the rig thru the pc to the log without entering it. Also picks up Mode and freq info from rig and transfers to Packet spot with 2 key strokes.

Antenna tuner works from 160 thru 10 but is a little flaky on 12m. Noise blanker, filters and VBT work better than my 930's did as well. Have heard some good reviews on the 270hz filter by the RTTY guys but I only have the 500 in mine.

Has 100 memories plus 5 quick memories which are great for S&P during contests.

If lightning got mine tomorrow I would buy another in a heart beat. By the way it is very easy to service compared with my 930 as well. I blew out a couple of the band pass switching diodes in the RF board (my own stupid fault, long story) took about 20 min to isolate and less than 45 minutes to replace. This was the first time I ever had the screws out of it could do it in half time the next time. Was real well laid out inside.

Guess I'm sold...hope you are too!
Think you may be on the same cluster with us up here in Spokane, will check after I send this. Since Boise not that far away keep your eyes out for a used tower been looking

Dave,

I agree with your general assessment of the 850. I have had one since Sept. 1993, and I love it.

You can set the RIT/XIT to +/- 2.7 kHz in the setup menu. It also is set up to work with a transverter. You have to supply 12V on a pin to drop the output, so you need to be careful how you set it up so that you don't accidentally fry your transverter.

I haven't had any problems with the antenna tuner on mine. What type of antenna are you using; could this perhaps be the cause of the flaky matching on 12M?

Like you, I would promptly replace my 850 without hesitation if something happened to it. It's a great rig!

73,

Jeff, KC1MK (kilgore@tivoli.com)

Message-ID: <ko4ta.50.010BB218@mindspring.com>
Source record: 221981

Ok starting over from the top. I am sorry I didn't post the proper information. I was in a hurry to get to church this morning. So here is the information:

Time: 2100 eastern
Place: 3.975 mhz
Day : Friday night
Net conrol operator : KO4TA DonDon

Thanks to all who sent me Email so I could get back in here and straighten this out.

Yes it is coming at a good time that the 3.898 traders net is ending on Friday nights. That is by design. Bill and George are going to be helping get this one going.

So drop in and list something and let's have a good net.

Thanks again.

Don Simpson

This is a question for ICOM W2A users.

I have a W2A that I also listen to the local PD with at 155 Mhz. The problem is that the squelch only works at this frequency after the radio has heated up a good bit from either transmitting or from being in the sun. Does anybody else have this same problem? If so is there a fix for it?

Source record: 221906

I just passed my 13 WPM code on Saturday and am now General class!! Hoo boy was I nervous!

Now that I have access to some HF bands, I'd like some advice:

As a no-code Tech for a couple of years, I have a dual band 2M/440 handheld but no HF equipment. What kind of used equipment should I look for for HF communications? What should I avoid? Price is VERY much a factor and space is somewhat of a factor (small desk).

I know this is a very broad question, but any perspective, tips, etc. that you can provide as I consider what to do next is greatly appreciated.

--> of interest to mobile radio installations

Here's an interesting article that appeared in my local paper Saturday regarding tires and static charge buildup that may have some effect on mobile radio installations.

This article appeared in the Saturday, Dec. 17, 1994 ARIZONA REPUBLIC.
"Click and Clack Talk Cars"--Tom and Ray Magliozzi--King Features

Dear Tom and Ray:
Every time I get out of my '92 VW Jetta, I get zapped when I touch any part of the car's body. Is there anything I can do about this annoying problem? How long must I suffer?
Every time I get out of my '92 VW Jetta, I get zapped when I touch any part of the car's body. Is there anything I can do about this annoying problem? How long must I suffer?
"Oh," the toll taker said, "another one of those (expletive) new Accords!"

--> posters note: Silica is basically glass (a good insulator). Carbon black is a semiconductor which finds frequent use in static discharge applications (like those smoky-looking anti-static bags that semiconductors get shipped in).

Hmmmmm....
scott nx7u@primenet.com

I've got a TS-520 and I like it. If it decelops a problem I stand
a good chance of being able to repair it myself instead of sending
it to Japan or Taiwan or China or someplace. I will never part
with it. The rig has worked the world on 25 Watts on an attic dipole
on SSTV and CW. I don't use it often because of RFI (have to live
with the neighbors). I keep the power at 20-25 Watts when operating
it. Paid $350.00 for it at a hamfest. If you see one in good shape
I would say grab it.

Hi Dave:

I've had a TS-930S for about 12 years now, I guess. So far, I've not
found ANY radio I'd trade it for...

How do you find the QSK in the TS-850? I can't imagine ANY rig having a
better QSK setup than the '930... it's as smooth as glass and FAST,
too.. even with the relay... I run nothing but QSK, so am VERY careful
to check out any potential new rig's QSK the very first thing.

If you have time, what do you like about the '850 over the '930? ANd
vice Versa. I'm not necessarily in the market for a new rig right now,
but your info will be food for fodder later.

6576. FT530 400MHz noise

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-19 17:13:58 UTC
From: nolhier@laas.laas.fr
Message-ID: <nolhier-1912941809480001@gimli.laas.fr>
Source record: 221994

Hi,

I am using a Yeasu FT530 pocket transeiver, and I noticed lot
of noise on the 430 MHz band, especially due to the transmission
of commercial mobile phone (near 420 MHz in France).For example,
if I work on 430.625 (the local repeter) I heard sometimes mobile
phone transmission up to 6 QSK pts. And with few kinds of antennas
like portable antenna, car antenna and home-made J antenna. Does
anybody had noticed this trouble ?? Is there something to do
to avoid this problem ??
Thanks and happy christmas from Toulouse, France.
Nicolas

The only problems I have seen or heard of witht he htx radios is in the reveiver. seems that people have had trouble with frontend burn out when the rig is shared in a vehicle with hf equip. A friend of mine, whom i had tried to talk out of buying one of these, has returned his three (3) times do to his recv. going out. This is the short 2 months he has had it. I told him next time, demand a refund. They are just very fragile, and are even damaged when turned off, as my friend made it a habit to turn off the HT while using hf, and it still took out the front end.

On another note, the Radio Shack DSP unit is pretty nice!
As long as you like 800hz tones! Its great!

I am the proud owner of a late 70's vintage Kenwood TS - 180s (yes there are a few of us). Unfortunately I never bought the upgrade kit for the WARC expansion Bands when it was available. I tried to get it through Kenwood but I couldn't get a hold of anyone who knew what I was talking about. Finally, one of the guys a HRO in Oakland called the VP of the Amateur Radio Division and said the kit is no longer available through Kenwood. If anybody out there can tell me of another source for the kit I would really apreciate it. Send anything you have directly to me at myounge@pacbell.mobile.com.

Thanks

Mark

Sorry, no help from me, just commiseration. I have a FT-530 also, and there is a paging system of some sort that blows away the UHF side of my radio when it comes on and I'm within ~ 2km of the tower it's on. I think it's common to most -530s.

I have had the ECM replaced three times in my 1988 Corvette which I
bought new back then. I use a Kenwood 732 in the car in medium power.
Before that a Kenwood 721. I also had the same thought and questioned the
mechanics and service manager. They said that wouldn't do it.

I'm not so sure, but I have heard of non-hams having problems with these
things also

A couple of weeks ago, "Motorweek" included a segment on installing
and using CB radios in cars and pointed out that ECMs cn *very definitely*
be damaged or caused to malfunction by the RF fields from even a 5-watt
CB radio. It varies with the auto manufacturer, location of the ECM in
in the car, etc., but the bottom line was that *before* installing any
radio transmitting device in a car it would be well to check with the
manufacturer directly (and don't trust the dealer's word, sometimes
they don't have a clue about these things because it isn't something
most of their customers even care about). Personally, I'd check with
the mnufacturer *before* buying the car.

"Motorweek" pointed out that routing of the RF cable can be a
critical factor, as is location of the antenna. My own rule of thumb is
to (a) determine the location of the ESM; (b) mount the radio and route
the coax on the opposite side of the car from the ESM; (c) use double-
shielded coax; and (4) locate the antenna on the trunk or rear fender.

If using a high-power amplifier, I'd *definitely* put it in the trunk,
as far away from the ESM as possible, and "sniff" the connections for
RF leakage (you can buy self-adhesive copper tape to wrap leaky
connections, if necessary).

I put this chip in my 940 and can't say enough good about it. It
makes a klunky memory interface very nice, and the tuning knob
variable speed up with velocity sensing speed up is great.
PS this fellow is the place to send your broken 940 also.
I'm not associated in any way w/Jack...just impressed with a nice
job on the chip and a good place to send a 940.

Source record: 221914

Well, I'm going to loan out my spare 2m radio - a older Kenwood TR-9000
to a new-ham friend so he can crew on the Tournament of Roses team.
Unfortuantely two of the channels need PL and this radio requires an
external PL encoder...

I have the external encoder box, but I need the funny 4-pin plug
and Kenwood in Long Beach, CA. doesn't stock it any more.
The pin pattern looks like a flattened "Y", almost a "T".

So hopefully somebody out there has a spare plug available...

I can fake a mobile bracket

QST had an article about this, including the responses they got from the
factories. The responses varied from Volvo's 'We test nearly every
possibility' to Porsche's 'No non-Porsche equipment allowed'. The article
was in the Sept 94 (?, maybe Oct or Aug?) issue.

Well folks, I passed my Technician license last saturday.

While waiting for my license to arrive, I need some recommendation on
what HT to buy:

- What brand
- Single or dual band (I'm confused between 2m/70 and 2m/440)
- Mail order or buy locally (recommendation for a reliable mail order store please)
- Do you recommend buying a mobile radio if I have an HT?
- I don't know much about radio equipment so please feel free to add anything
that I missed to ask.

Any information to be a good HAM operator is greatly appreciated.

Thank you all. Have a Safe, Happy Christmas and New Year to every one.

I have just got off the phone after talking to Kenwood Communications,
the official stance is you bought it you own it! They will give you a
coupon to redeem for more Kenwood stuff (sounds like the Supercut threat
of "give us one more chance and we will screw up your hair for free!"). I
really feel screwed on this one! A week before I had purchased my TH-79A
I had called Kenwood in Long Beach and they assured me that the TH-79A
had the same feature set as the TH-78 plus additional features as well!
If you have gripes about this write to:

Here's a file that I received from someone else...good luck!

OK, here's the first one I found, gives you rx/tx 140-174 MHz and rx/tx 420-470 MHz:

DISCLAIMER: PERFORM THIS PROCEDURE AT YOUR OWN RISK. THE POSTER(S) OF THIS PROCEDURE ASSUME NO LIABILITY, AND THIS PROCEDURE IS POSTED FOR GENERAL INFORMATION ONLY. THE FT-51R RADIO IS NOT FCC-TYPE ACCEPTED FOR TRANSMISSION OUTSIDE OF THE AMATEUR RADIO FREQUENCIES. THIS MODIFICATION ENABLES TRANSMISSION ON FREQUENCIES OUTSIDE OF THE AMATEUR RADIO BAND, AND IS LEGAL FOR THOSE INDIVIDUALS WITH MARS/CAPS CERTIFICATES. THIS MODIFICATION REQUIRES THE USE OF A LOW POWER FINE TIP SOLDERING IRON. INDIVIDUALS WHO ARE NOT EXPERIENCED WITH SOLDERING OF SURFACE MOUNT TECHNOLOGY SHOULD NOT ATTEMPT THIS MODIFICATION, YOU COULD RUIN YOUR RADIO.

1. Remove the battery pack from the radio.

2. Remove the four screws directly beneath the battery pack on the radio.

3. Remove the two screws holding the contact portion of the battery compartment

4. Remove the screw and battery pack release lever.

(the following steps make removal of the battery holding compartment easier)

4. Remove the four screws on the bottom portion of the back of the cabinet. Carefully remove the two halves of the radio. Pay attention to the gasket as you are seperating the cabinet.

5. Remove the battery pack holding compartment.

The section you will know be working with is directly underneath the battery pack holding compartment (behind the touch tone pad).

6. There is a ribbon cable connected to the control board. You can leave the ribbon cable attached if you're a GOOD solderer, or you can release the two little black levers on each side of the ribbon cable and CAREFULLY

slide the ribbon cable out of the socket and hold it back towards the case with a piece of tape. Be careful not to put a bend in the ribbon cable or pierce it.

7. Locate a set of etched jumpers on the pc board. They are located adjacent to the bend in the ribbon cable. They are not marked, and are situated as follows (o-o indicates closed, o o indicates open):

JP1001 o-o
o o JP1005
JP1002 o o
o o JP1006
JP1003 o o
o-o JP1007
JP1004 o-o

8. Using solder wick or your preferred method of solder-removal, carefully remove the jumper for JP1007. This enables the 134-174, 420-470 MHz transmit.

9. Reassemble the radio, remembering to reinstall the gasket, and to carefully reinsert the ribbon cable if you removed it from the socket, and fasten down the little black socket locks.

10. Press the MHZ /\ and MHZ \/ buttons simultaneously while turning the power on to the radio. This enables the modification.

Some notes: I experimented with removing JP1004, and it had no apparent effect. I did not experiment with any of the other jumpers except JP1007. There still may be 800 MHz receive buried some where in the radio, the Japanese version has 800 MHz receive. An earlier posting of mine indicates four large resistors (well, non-surface mount) connected between various microprocessor and memory pins, clearly an add-on. Experimentation with removing these produced no effect, HOWEVER, this was prior to my discovery of the JP1007 mod. I've played with the radio enough now, and don't want to push my luck, so let's let someone else try to find out if there are any more secrets buried in this fine piece of gear.

A friend was given about 100 feet (out of a 300+ foot tower that fell) of tower that he says is either Rohn 45 or Rohn 55. He's not sure which; he's been given assurances from different people that indicate that it is both.:) Here's YOUR chance to weigh in on this issue:

It has the welded-on section matings, not the reduced-diameter ends that fit into the normal-size end of the section above it. It is big, triangular-sectioned stuff. So, does that make it commercial 45 or 55? Is this enough information to tell?

Your considered opinions/expertise are appreciated.

Hi all, (and Med - who I met at the Exam)

Somehow I sneaked through the Morse Test too. So while I await the
callsign, I would also appreciate some (the above ???) info on a HF
rig. (alas I live in an apt complex too).

I'm looking to buy a TNC. I'm a complete novice to Packet, so
have to go on recommendations. My field is electronics, computers, and
communications, so the technical aspect shouldn't be a problem in any
case. I run a busy dial in BBS, and would eventually like to interface
it to a packet BBS, but for now I need to get my feet wet. It will
probably be 2m or 70cm for a while. I am considering the mid priced
Kantronics 1200/9600 unit and would like some suggestions and feedback on
that one and others. I'm also interested in APRS to the extent that it
can be utilized on 2m and 70cm.

How about some suggestions..... please

>rhett westerman
>kd6mrg
I've owned a W2A since July 1991 and have never encountered the problem you've
discussed. Check the connections between the VHF squelch pot and the mother-
board. A bad connection between the squelch pot and the motherboard is
not frequency sensitive but this is the only problem I can think about.
NOTE: ANY work inside a W2A is neurosurgery! I know!

>I am thinking about buying a TS850 and would like to hear your
>opinions of the radio.

I have had the 850 since January of '93 and enjoy it. Only complaint is the various vox controls are in the back of the radio. I have all of the filters which work well. Has 100 memories plus 5 working memories which are great for contesting. Also, the Digital Recording Unit (optional) is great for ssb contesting as it sure saves the voice. The only other radio that I would consider is the Yaesu FT990.

I have a dual band HT, an ALINCO DJ 580-T (US version).

Is it possible to modify it to get frequency coverage (on
transmitting) on 70 cm to include the lower part of the band,
i.e. 432.000 and up? Or do I need a "software" mod?

> Could some kind individuals send me some comments on the Kenwood TS-520. I am
> interested mainly in CW.

My first rig as a CW'er was a TS-520.
At that time my demands on CW operation where not high-tech, QSK, etc.

Once I got my hands on the rig it needed balancing of the finals - and I did
this operation on my own by help of the service manual and a DMM.
The tubes where in a reasonable good shape.

Later I discovered that the RX part needed some re-alignment - I think that
I could have done without this operation, but I managed to tweak the RX some
by consulting the service manual, and turning those ferrite cores
VERY gentle. I had a radio service instrument for pro-radios at the time that
proved my efforts. yes - the circular band switches needed some cleaning as
they where oxidized or dirty.

I later purchased a Kenwood 520 '12V to AC' DC/AC converter at a hamfest.
I hooked on and soldered on the cords to the AC inlets,
a pretty simple operation.
I then managed to have my first CW QSO on 10M, while driving.
The 520 delivered less power on 12V DC, 25Watts or something in that range,
while the DC/AC converter made lots of noise during TX.

Later the 520 was swapped for a 520S with the digital LED frequency
counter/display available from Kenwood, mounted on top of the rig.
I think I would try to install a narrow CW filter if I had a 520 today.
I was not all happy with the original CW bandwith at RX.
The tuning procedure on the TX did take time at band changes.

Today I have a small FT-77 from Yeasu. The TS-520 is a heavy piece to
carry if it supposed to go in my bagpack and not needing 12V for operation.

If I had need for a 2:nd rig at my summer/vinter house, I would have kept it.

: but your info will be food for fodder later.

: 73 - Tom Hammond N0SS

Tom
Things I like about TS-850 over my old TS930

1) The filter setup is better and selectable. On the 850 I can choose any filter in either IF in any mode.

2) 850 has a computer interface 930 does not. Graet for auto logging programs, computer rig control, contesting.

3) 850 has 100 memories plus 5 quick memeories. I put all the places I want to listen in the 100 memeories (ALL WWV freqs, net freqs, standard DXpedition freqs etc in the 100 memeories) The 5 quick memeories are great for S&P during contests.

4) The sideband is selectable on CW (upper or lower) your choice. The 930 is not.

5) The 850 allows you cut out some of the front end gain (AIP) rather than just throw in attenuators in strong signal conditions. Better dynamic range results in contest situations.

6)IF slope tune is more effective than the 930's VBT.

7) I work on my own equipment and the 850 is much easier to service than the 930.

8) The noise blanker seems to be a bit more effective on th e 850 compared to the 930. Hard to quantify this one

9) Built in CW keyer with memeory took one more piece off the operating table.

10) Built in antenna tuner covers 160M the 930's only went down to 80M

11) The unit will allow different filter selections for the split VFO's. This is real handy when your working rare DX (tight filters) on VFO A and want loose filters when your searching his pileup 5 khz up on VFO B trying to figure out where he is listening.

THINGS THAT DIDNT CHANGE:

1) QSK is same on either rig. The 850 is a bit noisier but since I wear phones dont pay much attention.

THINGS THAT I DONT LIKE AS WELL:

1)The RIT/XIT only tune +/- 2.7 khz vs +/- 10 for 930 . There is no zero reset like the 930

2) The VOX and TX delay controls are now around back. They were a pain to get to on the 930 in little door on top becasue of the way I "package" my stataion. They are even harder to get at now. Gotta buy a 950 to get these controls on the front panel where they belong.

3) I miss the audio filter the 850 has a very poor tone control and thats it. I went out and bought a DSP audio filter! Which does things the 930 filter never thought about anyway like hetrodyne removal on SSB that is another story.

4) I miss the analog meter on the 930 (but not much!)

Summary:

The bottom line is that the 930 is 15 year old technology the 850 is 5 year old technology...a lot can happen to technology in 15 years!
The 850 is definitely a better contest radio. It used to kill me to work 750 stations in a dx contest now I can do a 1000 and never have to use the key !

Good luck
Dave

Source record: 221942

I have a couple of them. Nice unit seems to work well. Consider
if you want a touch tone pad. If you need this you will need an
optional mike to give you the touch tone access. The programing
is cumbersome until you get used to it. I don't mind the programing
but then my work is very technical. The instructions are somewhat
larger than the radio. I think the lack of touch tones and the complexity
are why it has been discontinued. On the plus side it is as small as
any 2m HT and you don't have to spend another $90. to hook it to
your car cigarette lighter. For a first unit you might consider
something larger and more intuitive but if size is important it is a
good choice. 73 de Jerry KC5EGG

HELP!!!
A while back, university police searched my dorm room while investigating a theft on my floor.

During the search, one of the officers discovered my YEASU FT23R, and turned it on.

They discovered my radio had been modified to receive and transmit out of band.

The school charged me with possession of an illegally modified radio. I faught the charge and it was dropped.

Due to the trouble I got into for having other things in my room, (traffic signs, firecrackers, carbureter cleaner, etc) I am just now trying to get my property returned.

I went to court today to petition the return of my personal property, including the radio.

The university police, the local sherrif's office, and the states attorney all told the judge my radio is illegal to possess.

To the best of my knowledge, my radio is perfectly legal, so long as I never transmit on frequencies I am not licensed for.
(the sherrif's office had a fit when they realized it could be tuned to and transmit on their frequency)

I need to find someone who is familiar with the FCC rules and can tell me exactly which paragraph, section, subparagraph...etc. that will tell me wether my radio is illegal or not.

The judge is not allowing me to have my radio back, but I am going to try again if I can find proof that it is legal for me to possess in its modified condition.

I'm not arguing the morals of having a radio which is capable of transmitting on police frequencies, I am just arguing the LAW. I am a bit perterbed that the local police agencies don't need any proof to back their statements.

Any help is appreciated.

By the way, when I called the FCC, they indicated that there is no law indicating such a radio is illegal. They didn't have the time to muddle through the rules to try to determine if it IS legal.
I guess this is like saying that you can't find in print where it

is legal to drive 20mph in a 30mph zone, although if you read
more carefully, you can determine it is legal.

Thanks again.
Dave

>I'm considering the Yaesu FT-11R as a new HT. Any experiences would be
>appreciated.

I have had mine for 3 months, I love it!!!!!
It comes with a full manual and a mini manual. I carry the mini manual
with me, its only about 2" x 2". Lots of buttons & whistles to learn.
a very nice sized digital display, but I still put on the bi-focals.
I added the tone squelch board, it does make a diff. at hamfests!

I prefer to use alkaline batteries instead of rechargables so I bought
the AA Alkaline case as well.

I traded in my mini pocket sized standard C108A because it was a weenie!
I couldn't hit a lot of repeaters with only 200mw. Plus the worst thing
was that the battery cover would not stay on unless I put scotch tape over
it! No scotch tape needed for the FT-11R, it has an interlocking lever.
Standard should develop a clever lever too.

My Ben Franklin checksheet says:
Standard C108A (cute toy)(keep lots of scotch tape handy)
Yaesu FT-11R (fistfull of power)(move over weenie)(fits in pocket too)

OK , welcome to hamradio! HF in an apartment complex can be tricky... ARRL sells a book, something like Sneaky Ham Radio or Amateur On the Sly... I dunno, but its a collection of hints and kinks including sneaking hidden antennas in aprtment settings. There is also litereature on how to use the phone line as an antenna, reportedly fairly good, who knows, you might get great results and maybe even NOT get phone-interference complaints. I don't have a reference for the phone-line hookup, ask around here. The ARRL may even help you further, and will cetainly sell you the book for $8... see QST magazine for their phone number.

As for Handy-Talkies (HTs), I love Kenwood.. their TH-77 is still very good, I have 2 of their TH-78 babies, and I love them. Great for building upon, too, because I loved em so much, I got dual band base rigs to use cross-band-repeat thru, and they are PERFECT for that. The TH-79 replaces it, have no info on it. The wavelength runs inversely proportional to the frequency (as you should have learned to pass your tech test), thus 70cm is the wavelength of the frequency 440MHz. Thus, 2m/70cm equals 2m/440. These two bands are the most popular and, in my opinion, useful. If you live in a halfway good size metro area, you probably have one or more repeaters on 2m. 440 is less populated, but in Southern California, 2m is crowded and less crowds becomes a plus. Get involved in a local club to find out more. The absolute BEST you can do with ham is what I did... get into it very enthusiastically, then talk it up with friends and family members until they start getting licensed! I got my two best friends into it (unfortunately, I then moved away from them), and my wife also got a license. This makes it MUCH more fun... you can talk ham radio with your friends instead of making friends with strangers who use ham radio. If not, it is STILL worthwhile... if you drive, a mobile antenna for the car is a MUST (get the dual bander, of course). This will give you autopatch capability from your car (again, in metro areas with repeaters, clubs etc). You have to join/pay a fee (low fee). I love autopatch so much, I set up my own "patch". That means, while my buddies get their monthly phone bill for cellular, I enjoy the use of my own home phone line, and the low, low hourly rates it carries, within several miles of my home. This, of course, invovled more equipment. Remember there are also other modes, like CW, ATV (Amateur TeleVision), packet, satellite, and even EME (Earth-Moon-Earth, for the really rich or very serious)... each with it's own rewards. Above all, keep asking others about their experiences. Have fun! Ed - AA9IF

I went through this same predicament about a month ago. I solicited many
responses from this news group. In summary:
1) The Kenwood TM733A had early teething problems (Distorted PL tones
on tx, firmware menu problems), but these have supposedly been solved on
new versions
2) Not many owned an Icom, but I have read the 2700H has had faulty
diode problems affecting rx, factory working on a fix
3) Yeasu 5100/5200 had nothing but favorable reports. The only thing I
see as different on the Yaesu is that there is only one volume/squelch,
shared by both bands using a balance control. I kind of like that feature,
fewer knobs to spin.

I didn't end up purchasing a dual band mobile yet, but having owned
equipment made by all three, here's my 2 cents. Kenwoods are not that user
friendly. Their guts are good, but others are easier to use.Icom is
rugged, but Yaesu is the most user friendly. I have an Icom 229H that I am
in the process of selling. Know anybody who wants a mint never-mobiled one
for $325 US? When I sell it, I plan to get a Yaesu 5100.

6631. Safety & handheld radios

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-21 06:58:29 UTC
From: hmaxwell@netcom.com
Message-ID: <hmaxwellD15FDI.Ds7@netcom.com>
Source record: 221890

While merrily studying for my first license, I came across some cautions about the antenna on a handheld unit. The suggestion was to "try to point it away from the face and head". Well, even a pre-novice knows that the antenna ain't gonna get awfully far from my face or head no matter how much I twist and turn it. Since I'm interested in a hand held unit, I am wondering if anyone had scientific/medical knowledge they might share on this topic. I don't particularly want to fry my ears off, or set up third harmonics that interfere with the few brain waves I can still transmit :-}.

My questions are:

1) Should I avoid handheld units completely, except in perhaps for emergency use (this is an option I could live with).

2) Are handheld units reasonably safe at lower frequencies?

3) Are there any handheld units that allow the antenna to be detached so the user can stand back from it while holding the set?

We've all heard the story about the woman whose brain tumor was blamed on her cell phone. Any advice greatly appreciated!

6632. Solar charging query..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-21 07:37:15 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <1709324DBS86.WALLY@ukcc.uky.edu>
Source record: 221884

I am interested in using solar cells to charge my scanner, and quite possibly the ham radio I am receiving soon. I know a very little about electronic theory, and I would appreciate some help..

I can get solar cells from Rat Shack that produce .55vdc and .3amps, in full sunlight.. Putting these in series, I could get 6.05 volts and 3.3 amps from 11 cells. This is what would be needed for my scanner.. I would also like to be able to charge from 1 to possibly 8 AA cell batteries, in a case I could make for them.

What I'd like information on is how should I protect the scanner/ and or the cells? A diode on the hot lead to prevent backflow to the cells? The circuit would definately be fused.. But I am concerned about charging the AA batteries.. If I put 1 AA battery in by itself, I am sure the 6vdc and 3.3 amps would be way too much for it.. How easy would it be for me to do this:

Make a switch, set for 1-2 batteries, 3-4 battiers, or 4-8 batteries. (4-8 obviously because at this point 4 AAs and up would be above the output of the solar cells.)

How would I set this up? The current isn't a problem, just throwing in a resister with the proper ohms, but how about the voltage? Or would this be pointless, and I should just drop the amperage to about 1.5amps or so?

Sorry if this sounds so basic and stuff, but I'd hate to put time and money into this and it nuke itself and my batteries, and most of all my precious PRO-51 scanner.. :)

Also, if anyone knows any sources of solar cells, I would appreciate that as well.. Rat Shack sells theirs for $4.12 a piece, and that's a bit high I believe. But what from Radio Shack isn't.. Perhaps I'll call Marymac.. *shrug*

Thanks a lot..

Thanks for reading this.
Who can give me information about the performance of a TR700??
It is a all mode 2mtr transceiver with VFO, so it has no frequention display
but it has analog tuning.
Does this have some advantages?

What will the performance be compared to a Yeasu FT290 (with ampl)?

I want to buy a all mode trans. and these two are offered to me. I dont know
which one is best. But the FT290 is much cheaper (and newer) as the
Kenwood. (650 vs 900 Dutch Guilders).

Who can give me some information.
Thanks.

>Where would I start? What equipment would I need? transmitter, what else?
>How much money should I figure to spend?

Why do you want to go pirate? You are obviously aware it is illegal, right??
That's why it's called pirate. There are stiff fines if you get caught.

Do you want to actually broadcast some type of programming or music??
If that is your intent, check out alt.radio.pirate on the internet. But most
of the individuals there are not, IMO, nearly as knowledgable of RF as radio
amateurs.

If one-way "broadcasting" is NOT your intent, why not legally get on the air
via amateur radio?

You can enjoy world-wide conversation via CW (Morse Code) and single side
band (voice) on the frequencies below 30 MHz. (You must pass a Morse
code test for this. 5 WPM get's you started. 13 WPM needed for any real
access.

You can get on the air ABOVE 30 MHz without taking a Morse code test.
It's called the "TECHNICIAN" license. You can get a book at Radio Shack
called "Now Your Talking" that will answer all your questions.

With your TECHNICIAN class amateur radio FCC license, you can experiment
with and/or use and enjoy reliable portable, base and mobile local voice
coverage via repeaters. You can send files and ascii text via digital packet
radio. You can explore "computer networks of the air" using TCP/IP based
amateur radio "operating systems" which connect to "RF modems".
You can explore amateur television. You can have voice or BBS contacts
with amateurs world-wide via amateur satellites!! You may even have a
conversation with the crew of the space shuttle! No kidding!

Why not be legal? It may be more fun and educational than you can
imagine??

6638. Re: Modifications to HT legal? What does FCC say?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-21 11:58:51 UTC
From: kmagloughlin@delphi.com
Message-ID: <5WxUP07.kmagloughlin@delphi.com>
Source record: 221797

You have a problem and this is why. You possessed a radio that is capable of transmitting a signal in an area of spectrum for which it is NOT type accepted.

The FCC issues type acceptance for different areas of spectrum. This set of standards includes emission standards which of course determine signal purity, type of modulation, etc, etc. However, they also include certain features of of the radio such as being capable of having the frequencies being field modifyable, that is, they can be programmed in the field with out the aid of a "programming jig or adapter" or a "personal computer" loaded with the software that will allow such changes to be made. Wilson radio made both a mobile and a portable that was totally field programmable and due to some use by government agencies during sting and anti crime operations, the FCC changed the rules so radios could not be programmed anywhere except with an external device. (Really what was happening was a few government agencies were using the WH2510 and the Regency XL2000 mobiles as sting radios and would load whatever RF channel they wanted, conduct their operation and go away. This was done with no thought given to what channel they used, so long as it was quiet.)

The FCC's intent was to make programming a radio a technician's issue, not a user's function. This also helps as another step to curb unlicensed operation on channels where a user may legitimate need, yet no license. The example is, two fire companies who do mutual aid and have no mutual aid channel. One company will add the other companies channel into their radio without a license. That's not legal and in order to solve such problems, the fire chiefs need to sit down and either work out a mutual aid channel, coordinate and license, or one department needs to coordinate and license on the other department's channel. The point is, there are legal ways to get the job done and since out c/out/our tax dollars are being used to pay these public services, they damn well better have proper licenses for their equipment.

I digress here a little, but the type acceptance issue is the first thing. As far as the rules are concerned, anyone who uses a Icom IC04AT in the 462 Mhz range while doing med or ambulence work is in violation. Sorry, boys but tranmitting out of band is not acceptable. PERIOD. The employer should be providing a proper piece of radio equipment to meet the needs of the business and if this is not done, the employee does not need that radio even if the employer is properly licensed for that channel/channels.

Now we are to the second issue, the license. You had channels in your radio that were out of the ham band, that is to say, you were on their channel w without a license. I can see where they would get honked off. Again, you have to coordinate and license your operation. You did not do so. Violation number two. Why did you have those transmit channels in your radio? Is there ANY legitimate reason for you to have that/those transmit channels in your radio other than immediate health and welfare threatening situations? Sorry, "I had

them programmed just in case." is not good enough.

As for listening, there is no problem for a radio to have extended receive capablility. Receive all you want. If someone does not like you listening, it is up to them user of the transmitter to not allow you to receive that signal by means of scrambling, Digital Voice Protection, Digial Encription Standard, and many other means readiy available on the market. That is what the satelite television market did with Video Cypher. They protected their signal. The cellular people did it the communistic way by trying to ban the receivers. That pathetic attempt at protection was because the cost was too high to rebuild the entire cellular radio network in the country and replace every cellular telephone with one capable of secure transmission.

Digital cellular is only a matter of time anyway so the majority of the intent behind the communications privacy act is really going to be more meaningless anyway. I was listening to Larry King one night when he was still on at night talking with the president of the cellular industry figurehead organization and the caller wanted to know why the cellular industry wanted to ban receivers instead of securing their own signals. That guy got really indignant and wanted to know why the caller wanted to be an "electronic voyer". The caller used the example of the satelite industry and their approach to securing their why someone wanted to listen
to other's conversations. The industry rep was a jerk and he knew it. I am not sure if Larry knew what this was all about. Oh, well.

I digress again. Those are the two points they have you on. This is not a matter of violation so much of amateur rules as it is a violation of rules of another radio service, namely public safety/local government. That's were all this stuff is spelled out.

NOW...the only way you MIGHT be able to beat this thing is if you search the laws of your given state/county and local government for statutes specifically addressing possession of a "radio capable of transmission on a public safety communications channel" or words to that effect. If there is none, then they have seized equipment that they have no statute to back up. Some attorney out there could comment on reasoning "potential nuecense" or something like that which could justify the seizure of such equipment, but a straight seizure I don't think is allowed.

If they try to say they were upholding federal law, I don't think this will fly either because that would be like your local police making sure your septic tank is not poluting ground water. That is a job for the EPA or other agency. They have their own means of inspection and enforcement. That's teh key here, enforcement. The FCC is not likely to become involved here because they simply would not be interested in a single portable somewhere at a college that did not cause any interference. IF YOU HAD OR EVER HAVE CAUSED INTERFERENCE, IMO, that radio should be seized and destroyed.

The idea is your local police or campus police is not capable of enforcing federal rules of an agency. I believe the FCC cannot even do seizures on their own, they have to have federal marshalls along to execute a seizure orer or something like that.

You might be able to get off on something like that. If your judge will listen, good luck. The angle under which the radio was seized will be the question and the supporting statutes. I wouldn't hold my breath if I were you.

If and where I may be in error here, I would appreciate others informing me so I may keep this all straight. Please send Email to me personally. I am fairly certain of all of this, even if I have not addressed it in a while.

As for the final statement, out of band operation is not permitted except under dire circumstances. PERIOD. NO EXCEPTIONS. If you have the channels in your radio and they can transmit and you do so, that is a violation. No amount of ham attitude, ego, machismo, whatever can justify it. Ham radios are not cop radios and cannot be used as such. Cops do not need hams on their channels and that
's why the rules are the way they are.

If you do get your radio back, do yourself a favour and take those channels out as they are surely going to be looking for more reason to hassle you. You already admitted to having road signs. Are they going to charge you with using the radio in the commission of a crime? That is a federal crime the FCC does not have to become involved in and that may be the reason for the seizure.

Good luck.

Kevin

>RG 45.
>
>jim dixon, NL7HI
>dixon@vt.edu
>
The 55 has .120" wall thickness in 1.5" tubing and the 45 is .085".
This increases the cross sectional area of a leg. You can get 45 or 55
sections that have solid legs to extend the heigth of the tower.

>Can somebody tell me how to get in touch with the manufacturer/vendor?

Ugh. I rue the day my 745 battery dies. The ROM has to be reprogrammed
by the factory. Hmmm... maybe *THEN* I can talk the XYL into that
Yeasu 1000 Delta, heh heh.

Willco Electronics sells an ICM-1024 Memory Replacement Board
for a suggested retail price of $150. It was written up in the
July, 1994 issue of QST; page 79.

Adress of WILLCO:
POBox 788
New Lenox, IL 60451

Ciao de Jim

That's ridiculous! Personally, I'd be pretty pissed. Since you're looking for your answers here, I'd assume you don't have the bucks to hire a lawyer at present. If so, however, I'll bet you could get your radio back. It's as if they'd confiscated your car becuase it's CAPABLE of going over 55 MPH, or taking your gun because you CAN murder someone with it. I'll really bet you could win this fight with legal help.

IN FACT, I'm not sure I know what I'm talking about, but do the campus police have the legal right to search your room for whatever reason they want? If they'd been actual cops, I don't believe they'd have been able to seize your radio unless that's what the warrant said they were looking for.

It may not be worth much, but good luck. Keep us all abreast of the situation. And another thing -- contact the ARRL, and see what they have to say.

Kevin's post, while full of words, lacks substance.
In short, it answers the wrong question.

It IS NOT ILLEGAL to possess your radio no matter WHERE
it transmits! It is NOT ILLEGAL to listen to the local fuzz!

It is ONLY illegal if you transmit with it, and they cannot infer
transmission from possession! Type acceptance is totally irrelevent
to an amateur tranceiver. You're talking through your hat, Kevin.

Call the legal councel at the ARRL. 73 de AB5S/7

(stuff deleted)

Mark, why not do what I did? Take your FT530, and buy a mag mount antenna and the 12V car adapter. Take the battery pack off, and the whole thing is only slightly larger than a standard mic. You're on the air and mobile for cheap.

Only drawback is the audio volume is a little low, but I picked up a 99cent pair of in the ear stereo phones, plugged the stereo connector into the mono jack, figured out which earpiece worked, and cut the other one off. Works until I get around to building the amplified speaker.

Steve, you need to follow your own advice. I strongly suggest you get a copy of Title 47 of the Code of Federal Regulations and read Part 15 before you continue to spread such incorrect information and make a fool of yourself.

For unlicensed transmitters operating on the commercial FM broadcast band, maximum field strength at a specified distance is regulated - not transmitter power. At one time, at least 25 years ago, a power limit of 100 milliwatts of input power was permissible. It was never as high as 200 milliwatts. Now the limits are a maximum field strength of 250 microvolts per meter measured at three meters from the transmitting antenna.

With a conventional quarter-wave ground plane antenna, this works out to a transmitter power output of approximately 3 NANOWATTS. Most people report an effective range of perhaps 75 feet which is fairly consistant with theoretical calculations based on assumptions of typical receiver sensitivity and antennas.

Ramsey seems to be very careful in stating the federal regulations but I believe they never actually say the FM-10 is legal. Its power output is about a million times too high to be legal with a typical antenna, and it is well below the 200 milliwatts you erroneously stated.

I have to agree Kevin's arguments, while wordy and authoritative sounding, lack substance. If you did a mod to the radio and did not transmit no harm no foul. There is no legal reason for them to confiscate your radio. Even if you were not a ham, possession of a radio is not prohibited. However as you have found out local authorities can pretty much do as they please. The local magistrate often will have no legal training simply qualified for office by being in the right party. He will depend upon the police and DA for legal opinions they will often know no more but will sound good. Usually the only recourse is to hire a lawyer and spend far more than you HT is worth. Thus they win.

I think these folks have made up their mind and without a court order from a higher court than you have been to, you will not get back your property. You may get the most help from the ACLU. Call their local office; confiscation of property for no legal reason is a civil rights issue they may be interested.

I don't know how much you are committed to Adolf Hitler Tech but transfering to a school that has some respect for you and your rights may save you grief in the long run. Good luck 73 de Jerry KC5EGG

From: n1ist@netcom.com
Message-ID: <n1istD167C5.Eps@netcom.com>
Source record: 221876

In article <5WxUP07.kmagloughlin@delphi.com> kmagloughlin@delphi.com writes:
-The FCC issues type acceptance for different areas of spectrum.

Ham radios don't have to be type-accepted - that's why we can build our own.

-As far as the rules are concerned, anyone who uses a Icom IC04AT in the 462
-Mhz range while doing med or ambulence work is in violation.

This is true. The IC04AT (or any other ham radio) is *not* type-accepted
as a 462 radio, so it can't legally be used there.

-Why did you have those transmit channels in your radio?

Probably because most radios don't let you store RX freqs without TX, or tie
up extra memory channels if you want to set up a strange split (RX on 160.800,
TX on 145.62). It is a good idea, however, to at least set an offset on your
out-of-band RX channels so if you accidentally hit the PTT, you are not on
the local police freq.

-As for listening, there is no problem for a radio to have extended receive
-capablility. Receive all you want.

[Except 860 and 46/49 in CA]

-As for the final statement, out of band operation is not permitted except
-under dire circumstances. PERIOD. NO EXCEPTIONS. If you have the channels
-in your radio and they can transmit and you do so, that is a violation.

Not true. There are many legitimate reasons to use a radio to generate a
signal that is not in the ham bands - feeding transverters, as a signal
generator, etc. Also, just being able to transmit there is not illegal -
my signal generator could do it with no problem, and so could the commercial
radios sitting on my bench waiting to be moved to the ham bands. The
only thing that is illegal is actually *transmitting* out of the bands.

Hello Folks,

I was wondering where I would get some info about Homing Devices? Since most of you may be involved in some kind of pet-projects at home, I thought I will pose this question to you.

I am interested in a device which includes a set of transmitter and a receiver. I am looking for a 100-200 meters range and it should be preferably radio based technology. The receiver should be able to track down the transmitter from a distance. I checked all the local and Indy stores for this kind of device, but I am out-a-luck.

If any body has any pointers (I am also willing to build it on my own), I would be greatful to you. Any pointers to Electronics Projects Book will also be of great help.

Thanks once again in advance for any kind of help.

Mahesh Bagade

Morals aside, there's no federal reg that says possession of that radio is illegal (type acceptance, out-of-band capability, etc notwithstanding). You very well may have a problem on the state level, though. Check with you local and state authorities - I know in New Jersey it was illegal to possess in a car a radio capable of receiving police. Have the cops/judge cite the exact statute that they base their decision on - I bet they hem and haw.

PS - How did they determine that your radio could transmit out of band? By transmitting? They violated federal law big time if they did!!! They are in no way exempt from the same laws you are concerning radios and type acceptance. You might want to bring that up. Good luck, I hope the Nazis lose and give you back your radio. (You might give the ARRL legal team a call if you're a member).

>to an amateur tranceiver. You're talking through your hat, Kevin.

Careful, such absolute statements can bite you. It *is* illegal
to monitor police frequencies in some States with a mobile or
portable receiver. See scanner laws that equate such capability
with possession of burglar tools. (Kentucky and Illinois come to
mind) It is illegal to monitor police radar frequencies in Virginia,
and they'll confiscate your receiver if they catch you with one.
Also, the FCC itself will confiscate a non-Type Accepted radio
modified to transmit on CB frequencies. They hold that mere
possession is sufficient proof of intent to use in that specific
case. (I'm not sure this latter has been tested in Federal Court
for Constitutionality, but they have made such seizures.)

For the original poster:

However, seizure by local authorities without statutory justification
is a violation of the Fifth Amendment prohibition against the arbitrary
taking of property. The police *must* be able to show statutory justification
for such actions, and a good lawyer can make them "put up or shut up" on this.
If your State doesn't have a scanner law, there's no Federal statute that
specifically forbids *possession* by a person of a radio, of any type, that
covers police VHF or UHF frequencies. Nor, however, is there any Federal
statute that specifically *permits* possession of such a radio.

Our system of law is not yet based on the idea that everything which
is not mandatory is forbidden. Our system of law is based on the reverse
concept, that which is not specifically forbidden is permitted. The
police and judge *must* be able to quote a statute that specifically
prohibits possession of such a radio before they can confiscate it.
Otherwise, their action is no less than simple theft of your property.

You need a good aggressive lawyer who is willing to carry your case to
Federal Court if need be. And you need to be willing to file charges
of theft against the police and court if necessary to force them to
justify their taking, or return your radio. You want to nail them under

the Federal RICO statute if you can. That gets your radio back plus triple damages and legal costs. All this will likely cost tens if not hundreds of thousands of dollars if they want to fight you, and may take years if not decades, but you should ultimately prevail if the Constitution still means anything in this country.

6662. TH-22AT Mods Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-21 20:49:03 UTC
From: khurley@quapaw.astate.edu
Message-ID: <khurley.788042884@quapaw.astate.edu>
Source record: 221869

Does anyone have any Mods for the TH-22AT besides the MARS Mod.

6663. Re: Solar charging query..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-21 21:02:12 UTC
From: gary@ke4zv.atl.ga.us
Message-ID: <1994Dec21.210212.6831@ke4zv.atl.ga.us>

In article <1709324DBS86.WALLY@ukcc.uky.edu> WALLY@ukcc.uky.edu (Walter R Francis) writes:
>I am interested in using solar cells to charge my scanner, and quite
>possibly the ham radio I am receiving soon. I know a very little
>about electronic theory, and I would appreciate some help..
>
>I can get solar cells from Rat Shack that produce .55vdc and .3amps,
>in full sunlight.. Putting these in series, I could get 6.05 volts
>and 3.3 amps from 11 cells. This is what would be needed for my
>scanner.. I would also like to be able to charge from 1 to possibly
>8 AA cell batteries, in a case I could make for them.

False assumptions. The solar cell will produce 0.55 VDC when in full sun and *open circuited*. The solar cell will produce 0.3 amps when in full sun and *short circuited*. It won't do both at once due to the internal resistance of the cell in series with any real load. The cell internal resistance under full sun is about 1.833 ohms, but gets larger quickly with reduced solar flux. Full sun rating is in vacuum, with no allowance for atmospheric losses.

Also, cell voltages will add if the cells are series connected, but current will remain that of *one* cell. Or, cell currents will add if the cells are parallel connected, but the voltage will remain that of *one* cell. You can't just add currents and voltages at the same time in the same circuit.

>What I'd like information on is how should I protect the scanner/
>and or the cells? A diode on the hot lead to prevent backflow to
>the cells? The circuit would definately be fused.. But I am
>concerned about charging the AA batteries.. If I put 1 AA battery
>in by itself, I am sure the 6vdc and 3.3 amps would be way too
>much for it..

Indeed, it would be if that's what you got, but it won't be. With 11 series connected cells in full sun, you'll get an open circuit voltage of 6.05 volts, *or* a short circuit current of 0.3 amp, but you can't have both at once. The internal resistance of the stack will be 20.17 ohms. Depending on the internal resistance of the AA cell, the loop series resistance will be higher than in the short circuit case, so the current flow will be less than 0.3 amp, and depending on the AA cell terminal voltage, net voltage will also be less. A fully charged AA Nicad can source about 5 amps short circuit for a brief time. That's equivalent to an internal resistance of about 0.24 ohm. That puts the loop resistance at 20.41 ohms, and with a 1.2 volt terminal voltage on the NiCad, and a 0.7 volt drop across the steering diode, the net voltage is

4.15 volts. That gives a charging current of 0.203 amp. That's OK for a rapid charge cell, but about 4 times too much for a slow charge cell. You could safely charge 4 AA cells in parallel with this circuit.

Actually, circuit performance won't be this good under practical conditions, and charging current is likely to really be about half, or less, of what was calculated above.

Gary

Does anyone out there in Cyberspace know how to MOD the Yaesu FT-900
for expanded Transmit? I have a 3rd world two meter Xverter that I have
working on the FT-900, but need to be able to transmit from 26Mhz to 30Mhz
to get the entire two meter band.

Right now All I can transmit on is from 28Mhz to 29.999Mhz. This gives
me coverage from 146 Mhz to 147.999Mhz. I know that HRO sells a Blue
colored MOD book which claims to have it in there. I guess I'll have to buy
a copy if there isn't a person out HERE that knows how, but it is $20.00.
That seems a little steap for one little MOD page.

Please Help,

A good starting place is a book called something like "On the Air".
It is available from Radio Shack for about $20. (your friendly
neighborhood HAM store should also have copies.)

Go through Chapters 1 - 11 well. Then, just to make sure you understood
them properly, turn to the last two chapters and go through the quiz
questions. (It is important to know the answers to these questions.)

Once you are confident in your knowledge of that book, the next step
only costs $5.75 ($5.90 in 1995). After you successfully complete this
step, you are a ham radio operator. Then you can go and buy a transciever
and talk to people on the air. As with any electronic equipment, there
are no upper limits to what you can spend . I'm sure you can get
started for less than $300. (basic equipment - new).

Now to be a pirate:

You'll need a ship, a busted eye (with an eyepatch) and perhaps an
island to hide out on. Assuming that you are willing to start without
the island the cost of this venture could cost you upwards of several
hundred thousand dollars. (ship, crew, radio op. on the ship etc.)

So if you don't have a chunk-o-change handy, I would highly recommend
starting out as a Ham. Then, when you get you own ship...

Good Luck

Aditya

>I'll call Marymac.. *shrug*

The J.C.Whitney catalog has solar cell arrays ment to trickel charge
car and truck batteries. They come in several sizes and amperages
for a quite reasonable price. Check it out. Lots of ham equipment
can use cigerette lighter plugs for power so the 12v output is useable.
Good luck.

Congratulations on passing your test! I have a whole family of ham radio operators and have bought many radios for their cars, the house, etc. If you are watching your dollars (who isn't?) you might consider looking at the Radio Shack two meter H.T. You can run it off the battery or you can plug it into the cigarette lighter of a car and have 7 + watts. (I would ultimately go directly to the battery but the cigarette lighter will get you up and running, you may get a little noise, if not you're OK....much more power than that you really will be smarter to go directly to the battery.) My daughter runs around the Houston area and, with a decent antenna (outside, mounted on the car), we do pretty well on simplex....15 miles or so if I am working her with my base rig from the house, repeaters, you name it! Look around, maybe you can pick up a second hand one for $140 or so, brand new you might find it for $200 to $225. 440 and 70cm are the same. Many areas of the country do not have much of a selection on 440 / 70cm. The only reason

I might consider a dual band radio would be the ability to scan the non-ham bands. There are obviously many other very good radios (and much smaller), but I would certainly consider getting started without going to the bank. Again, good work! Keep us posted. KC...N5RVK

>radios sitting on my bench waiting to be moved to the ham bands. The
>only thing that is illegal is actually *transmitting* out of the bands.

If you are feeding a transverter or something along that line, you are not
radiating a signal for reception by others. You are using that signal to
create a signal to radiate. No problem. No violation. As for service
equipment, my service monitor can generate anything just about anywhere also,
but it is a piece of est equipment that has a purpose of servicing other
equipment, not facilitating communications. It's like a micor mobile and
a service monitor, both can transmit and receive, but the former is what
you would bolt into the trunk of a squad car.

I think your knit picking here a bit on my syntax. When I say out of band
operation, I am implying using the radio to talk to someone, such as portable
to portable, not as an exciter for something else like a microwave experiment.
Just thought I would clarify. :>

Kevin

Yes, we can build our own and use them as long as they conform to good
engineering and signal purity, etc etc. However, in order for equipment to
be MANUFACTURED AND SOLD in this country, I do believe ALL EQUIPMENT must fall]
somewhere under a type acceptance. So, as a result, I do believe there is a
type acceptance for amateur equipment that manufacturers must meet. I cannot
believe equipment can just be built and sold here without a set of standards
to meet. If that were not the case, any old piece of garbage can be sold
and be dirty as the manufacturer wants short of splattering everywhere.
Come to think of it, VHF engineering comes to mind. Remember their old
UHF 1 watt transmitters? :-> (shudder)

While I agree with you 100 % on the issue of transmitting out
of band,

Having a radio that is capable of transmitting out of band
is not in itself illegal.
The ham never said he did or intended to tx out of band.
There are literally thousands of vhf/uhf radios that have
been modified to tx out of the normal ham bands.
Not for the purpose of tx'ng out of band , but to receive.
Lots of hams like to listen to police and fire and other
public service, the mods to do this in all the radios I have
seen do not differentiate between rx and tx. You mod it so
it will rx, and the tx comes with it.

While it may be illegal for a non-fcc licensed tech to do any work
on a transmitter, hams are allowed to do this.

Aren't there services such as mars and ares that utilize spectrum
outside the ham bands for which it is legal to modify your radio
to tx there ? (I'm sure this is true for hfspectrum .)

Seems to me , this case is an abuse of power in that the gentleman
is being found guilty until he can prove his innocence.
What if this judge seized your corvette because it has the ability
to go 160 mph ? What person would ever have a legal reason to go
that fast ? Then the judge refused to give you back YOUR property
until you found a law that said "it isnt illegal to own a car that
can go 160 mph ".

Sounds like a dangerous situation to me when the citizen has to prove
They weren't breaking the law .

Exactly. Some folks have seem to forgotten that hams actually used to build their own transmitters :-). That's why the FCC exams (used to?) have a lot of stuff about knowing whether your signal is in band or not. The assumption was that surely the transmitter can go out of band, either intentionally or unintentionally and it is the ham's responsibility to know where it is in frequency. I am thinking of the older hf gear, commercial or military surplus but the same is true of all of the Micors that you see at Dayton....they are not illegal just because they happen to be crystalled for the local sheriffs freq. (Again, use of said transmitter on said freq is another story.)

It seems that the appliance operator phase of ham radio has made us forget that we really are responsible for knowing what freq we are on.

And I think your sig gen example is a great reason to own a radio that can transmit out of band. As long as you don't radiate its not illegal.

I have had the FT11R for a few months and love it. I have flown
all over the US and into the UK and Middle East and enjoyed it
everywhere. I love the air band receive facility and it has some
really neat scan capability.
Watch out though for its overload performance in cities with lots
of signals. It really could do with an extra filter on the front
end for the ham bands if you really want to use it around lots of
out of band signals.
I use it mobile as well and with the mobile pack it works fine.
Now setting it up for mobile/portable packet.

Go for it!

6684. Kenwood TH-79A Mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-22 07:21:54 UTC
From: emeb@indirect.com
Message-ID: <emeb-2212940021540001@s203.phxslip2.indirect.com>
Source record: 221798

Hello,

I've recently gotten a TH-79A, and while studying the schematic came across the 800 MHz circuitry. I imagine that this little teaser has made quite a few folks look twice, and a quick scan of the Mods directories of several popular FTP sites has confirmed this. All I have been able to learn so far is that there are some diodes that can be removed to open up the 87-175 MHz VHF and 420-511 MHz UHF bands, but so far nobody has figured out if the 800 MHz circuits:

a) actually are installed, and

b) can be activated (either by a keypad sequence or diode/jumper)

Having come to this newsgroup only recently, might I ask if there are any new developments in this area, and would someone please direct me to the information if it does exist?

Thanks

>Come to think of it, VHF engineering comes to mind. Remember their old
>UHF 1 watt transmitters? :-> (shudder)

Amateur equipment, commerical or homebrew, does not require Type Acceptance,
and none have it. Manufactured equipment has to meet Class B RFI standards
if it contains a microprocessor (most do today), has to meet Part 15 emission
limits for unintentional radiators if it contains a receiver, and has to meet
Part 97 standards for HF external amplifiers if it is one, but Type Acceptance
is not required.

OTOH, equipment operated in Part 90 service *must* be Type Accepted.

6686. TS700 vs FT290

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-22 11:38:56 UTC

>Date: Wed, 21 Dec 1994 09:59:17 GMT

Thanks for reading this.
In my firts question I made a mistake and wrote TR700 instead of TS700.

Who can give me information about the performance of a TS700??
It is a all mode 2mtr transceiver with VFO, so it has no frequention display
but it has analog tuning.
Does this have some advantages?

What will the performance be compared to a Yeasu FT290 (with ampl)?

I want to buy a all mode trans. and these two are offered to me. I dont know
which one is best. But the FT290 is much cheaper (and newer) as the
Kenwood. (650 vs 900 Dutch Guilders).

Who can give me some information.
Thanks.

Rinze (PE1PSW)

ps: Dave (WB0GAZ) thanks for your reaction and correction.

>
> We've all heard the story about the woman whose brain tumor was
>blamed on her cell phone. Any advice greatly appreciated!

The entire area of RF bioeffects at extremely low field strengths is
highly controversial. Studies point both ways in contradictory fashion.
However, there is little disagreement with the ANSI exposure limits.
You do not want to operate above ANSI limits. The ANSI limits vary with
frequency, with low frequencies (like HF) having a higher limit. For the
VHF/UHF spectrum, the continous exposure limit is 1 mW per square centimeter
at the biological surface. Occupational exposure, with a 8 hour limit, can
be higher, with the standard calling for an exposure limit at VHF/UHF
of 10 mW per cm^2. The latter limit is appropriate for handheld use.

Since the radiator isn't a point source in the near field, the power
of the unit is distributed along the antenna. A longer antenna will
have a lower field, in general, at each unit length than a short
antenna. (The near field is complex, and generalities don't always
apply.)

What does this mean in practice? Well the cellular industry uses an
output power of 0.625 Watt as the maximum for handheld cellular phones.
These phones typically have the radiator right next to the head. For
a HT, the near field of the antenna is somewhat complex, and it's
possible to orient the unit to reduce the field strength to the head

by pointing the tip of the antenna away from the head. A maximum power in the range of 5 to 7 Watts *may* be within the standards, or not, it depends. Using the HT on a low power setting, when feasible, will be safer.

Nearly all amateur HTs use a BNC connector to attach the antenna. The antenna can be replaced by a coax cable run to an external antenna. Using this would be a good idea except that nearly all HT manufacturers make their receivers too hot in order to compensate for the poor performance of the rubber duckies they ship with the radio, and they make the receivers too broad in frequency coverage in order to imitate a scanner. When used with an external antenna, most will overload severely and suffer extreme intermod. This can make them essentially unusable in areas of high RF activity such as metropolitan downtowns or near transmitter sites. If you must use a HT, try to find one that has tight filtering to limit RF ingress to only the ham bands (the Radio Shack units excell at this), and one that does not have excessive sensitivity.

By far the best approach is to eschew the HT and use a mobile rig with a properly installed (drill the hole) external antenna. This will limit your RF exposure both from distance and from the Faraday shielding offered by the vehicle. Thanks to the excellent shielding offered by a center of roof mount, you can run 100+ watts of power without approaching the ANSI limits inside the vehicle. This will make you less noisy in repeaters (thus making it more pleasant for others to listen to you). If the radio is also properly filtered, more likely with a mobile (not Kenwood unfortunately) than a handheld, there'll be less intermod in your own receiver (making it more pleasant for you to listen).

Kevin,

If I understand you correctly, you believe that possession of a radio capable of out-of-band transmissions is illeagle, and that the police is right in confiscating it.

Well than they should confiscate *most* HF radios currently in use, since they are not only capable of transmitting out of band, but of interferring with several security relevant services.

> I'm thinking about buying a Yaesu FT 900 AT. Anyone have good/bad experiences
> to relate??

I have had several Mobile rigs in the past 5 years.
1: IC-725
2: TS-140S
3: TS-440S/AT
4: IC-735
5: FT-890/AT
6: FT-900/AT

I would say the FT-900 is up there on my personal list of the favoite's.
I have not had much time to use it at home, but as a mobile rig this rig
has a great receiver, and pulse noise blanker. And lets face it the receiver is
what makes a rig better than the others. The transmitter runs 100Watts output.
And the modes are all there.

By the way I grew up in Allen Park, Mi. Went to Wayne State University.
73 and good luck.

Down East Microwave makes a 6 meter transverter that is "almost" assembled. As I recall, it is almost completely built on a single PC board that has all components. The amplifier is a "brick" with around 25 watts output. The IF is 28 MHz. They may have a complete unit available. When they first came out with it, it was only in the kit form as I described because of the expense of getting the unit FCC type accepted. The kit takes only a few hours to wire together since the PC board is complete. It's a high
quality unit with a high level mixer.

Liang:

Any particular areas of interest? I have had MANY vhf rigs and the 281H is the best yet! It's a great rig. There lots of nice radios out ther from Icom, Kenwood and Yaesu, and it's just a matter of what you want to do with it.

The 281H has tons of nice features, including lots of scan modes (with sets of upper and lower limits for each band!), and is easily modified for extended RX in the "RX band".

> I'm looking for more specific data on the FT-530 mods. Does anyone have
> the details.

Steve:

When I bought my FT-530, in the summer of 1993, Yaesu was kind enough to fax me a two page modification, that 'opened-up' the receiver so that it would cover all the way down to 110 MHz (I wanted to listen to aircraft).

Since then, due I think to the law about monitoring Cellular traffic (yes ... the Yaesu mod also gave the FT-530 800 MHz coverage), I've heard that Yaesu won't give out any modification information now.

If a buddy of mine will ever return the modification sheet that I got from Yaesu, then I could describe the mod, but until then all I'll say is that I hope you have a later production unit ... as Yaesu changed a "zero ohm" resistor (surface-mount 'jumper'), as was on my unit, to a little wire jumper. A friend, who bought a FT-530 at Daytom in April 1994, had a MUCH easier time than I'd had. Removing the surface-mount "zero ohm" resistor on my unit terrified me ... doggone thing was almost microscopic. On the newer units, you apparently can just 'snip' the wire jumper. There are still (if memory serves me rightly) a couple of itsy-bitsy solder-blobs, that 'jumper' little 'pads' together, and those have to be removed, but simply touching a small, terperature controlled, soldering iron to them seems to work well ... the solder 'wicks' to the soldering iron tip, and isn't too difficult.

Whatever you do ... be VERY CAREFUL ... one slip of a soldering iron and your FT-530 might be an expensive paperweight.

A comment .... I called Yaesu, to ask if it was normal for my FT-530 to have a fairly severe 'image' problem, with 2 Meter ham repeaters 'busting-through' when I was listening down in the commercial aircraft band (yes, I had the AM detector on). Yaesu said that was normal, with the receiver's 'front-end' only 'tracking' (RF preselection) when it was inside its 'non-expanded' coverage range.

I have an Yaesu FT-11 for about 2 months. It is my first
rig as a no-code technician licensee.

I bought the high power version and an aftermarket
4.8V battery from Battery Tech with 1500 maH.

The high power version comes with a 9.6V battery, 600maH.

Memories: 120 (numeric - less if you use alpanumeric)

Transmitted audio: good

Received audio: distorted at higher audio levels, I mostly
use a Radio-Shack speaker/microphone

Power output: 5W at 9.6V is adequate for many repeaters in
SF Bay Area, 1.5W (?) at 4.8V is only good for local
repeaters

Rubber ducky antenna: Useless, I use an AEA 1/2 wave extensible
antenna (or a copper J-pole at home).

Intermod vulnerability: The radio is very vulnerable to intermod
and interference from major nearby RF sources: nearby
personal computers, workstations, and downtown pager transmitters.

However, this seems to be true of many small HT's.

Programming: not too bad after you get used to it.

Keypad: numbers (not captions) are backlit - good at night.

Keypad: button spacing is large enough for big fellas (me).

Size/weight: One of the smallest HT's, quite thin, fits in my
shirt pocket, even with larger battery.

I would definitely try to get the high power version. There is
also a 7.2V battery, but I couldn't find one.
B
Biggest problem: No external power jack - you have to buy a PA-10
for $70 - regulator + fan.

Other problem: it overheats if run for long periods on 5W.

6711. Advice on dual band mobile rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-23 02:40:46 UTC
From: olken@mendel.lbl.gov
Message-ID: <3dddbe$eco@overload.lbl.gov>
Source record: 221839

I am planning to get a dual-band mobile rig,
mostly to use a base station. I am especially interested
in opinions on various recent rigs:
Yaesu FT 5100, Icom 2340H, Kenwood 742, ???, and
Standard C5168 (?).

I am especially concerned with intermod and
interference rejection. My experience with
a small HT has been disappointing.

I also have some concern about ease of programming
and use.

Frank Olken, KE6NKY, Berkeley, Calif.

>of IC-271, IC-471, IC-1271. Are there others to avoid?
This is no defect. Use some math and figure out the lithium battery should last some 20 years with the RAM board drawing 30 nano amps of current and the lithium battery supplying over 150 milli amps. Every one worries this to death, in reality Icom America only sees about 30 RAM boards a year and over 3/4 are from users who tried to change the battery. if the battery is at 3.0 volts change it, if at 3.35 volts it is like new, no need to worry. I have never heard of a battery up a quitting with out someone helping it along. When the radio is in use, the battery is also out of circuit. I used to work for the company and know what I saw.

>since they are not only capable of transmitting out of band,
>but of interferring with several security relevant services.

The police only have a right to do something like confiscating a piece of equipment if there is a law that says they can. In this case there is no law to support them. What they did by law was wrong. What I was trying to show was the two angles of 1) Not having a license for that channel as programmed in the radio and 2) Not having a type accepted radio for that radio service. If both of these conditions are met, and he had a Motorola MT2000 portable and a license from the FCC for that channel, he could tell them to go pound sand and there is not a damn thing they could do about it. When I say Motorola MT2000, I mean substitute any radio here, GE, Wilson, whatever, as long as it is type accepted for the radio service in question. The police do not own their frequencies though some think and act like they do. Enforcement of same is not their job.

The real way to solve this problem is for all radio manufacturers to disable transmit for any frequency outside of the 142-150 Mhz range. There is not a single legitimate reason for transmitting outside of that range. All right, for the knitpickers out there, substitute the word "operating" for the word transmitting. The same should apply to the 420-450 Mhz range. There should be no radios sold or manufactured that can be modified. How many requests for mods do you see come through on this group?

As for HF radios, they are different than VHF/UHF mobiles and portables as there is no commercial use for them. Or if there is, there is little use. A VHF/UHF radio has uses that make it valuable to modify. Take a look at that clown from Indianapolis that shows up at every hamfest and makes THOUSANDS every weekend modifying portables. You cannot tell me he is just adding extended receive in everything. You probably would not know of his activites being over in DL land, but anyone from Kansas City to Baltimore knows of him. He has been at every hamfest I have attended.

I think the FCC should enact a rule forbidding modification for EXTRA extended transmit and modification just like they did for the 10 meter linear amplifiers. Really that rule should be lifted as I believe there is no more problem in the CB band, but the same concept should apply to the VHF/UHF radios as now they

pose this new problem that really needs to be addressed. Receive all you want because when there is no transmit capability, there is no problem.

Kevin

6714. Where can I get EMI filters for my PC ??

Hi Folks !!

I'm trying to get rid of RF emissions from my PC, and need to find a source of plug-on EMI filters (9 pin and 25 pin) for the serial and parallel ports....does anyone know WHERE in Canada or the U.S. I can buy these goodies ??

I checked with one source here in Vancouver....but the pricing was absolutely ridiculous - $25 to $40 U.S. ** EACH ** (!!!!) with a 10 piece minimum order....surely these things are available in small quantities at a more reasonable price.....

Oh, yes, I am interested in supressing radiations near the 2M ham band......

Thanks in advance for any ideas !!

There are two wires under the plate that is above the battery that are loops (comming out of the pc board and returning. Cutting the one the is not red and reseting the radio opens up receive. The red one (which I did not cut on my radio) I think opens up transmit. I did this years ago so you might want to double check this. There is also a third wire but it runs to the battery connector. DJ580 is a nice unit but you cannot listen dual band with CTSS on both bands at the same time (the sub band is carrier sq only).

6717. Band Edge mods for IC-725/728?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-23 08:33:21 UTC
From: asirene@omega.ntu.ac.sg
Message-ID: <1994Dec23.163321@omega.ntu.ac.sg>
Source record: 221835

Does anyone know if its it possible to modify the IC-725/728 (or most of the ICOM radios for that matter) so that it will transmit exactly from the band edge instead of 100 kHz below? For example, the 725 will transmit from 13.9 MHz up instead of from 14.0 MHz. Does anyone know if such a mod exists?

Secondly, the IC-725 transmits from 7.0 to 7.3 MHz for the 40 meter band. But in IARU Region 3, 40M is from 7.0 to 7.1 MHz. Does anyone know if such a mod exists?

I suspect the mods lie with D57, D58, D59, D61 and D63 but I cannot find any information on this. I will appreciate it vy much if anyone can furnish me with this information, or help me locate this info. Thank you vy much.

250 milliwatts? Think again. Remember that HT's, on low power,
can transmit over a great distance with just a rubber duckie.

Hook that up to a beam, and your 250 mW can go many, many miles.
I remember working into the U of MD repeater from on top of a
mountain on Skyline Drive, out near Luray, VA. 90+ miles, 200
milliwatts and full quieting into the repeater.

Heck, the U of MD's FM radio station runs 8 watts, and can be heard
all over campus and even a little beyond. 200 mW is 1/40 the power,
which equates to 16 db or about 2.7 S units...

Hi Ken,

I have the new Ten-Tec model 1208A 6 Meter transverter and have nothing but good words for it. I bought the assembled and tested version. The kit costs around $95.00 and the assembled version around $150.00.

The unit transmits with 5 watts drive, 8 watts output. The IF is 20 Meters, 14.0 MHz equals 50.0 MHz, 16 MHz equals 52.0 MHz, etc. It receives and transmits great.

I have a Cushcraft 5 element yagi and in the past two months have made many contacts between Kansas and Connecticut and up to Canada and all in between, I live in the central east coast of Florida. I have only been on 6M for two months and have yet to hear openings overseas.

The unit is small, around an inch or so high and approximately 7 inches wide, 5 inches deep. It has a power switch and pwr LED on front. It also has an antenna switch on front to toggle 6M and HF antenna lines. In HF position you can operate HF normally up to 100 watts feedthru.

I would say it's an excellent and rugged unit, I know it's rugged because I have accidently overdriven the unit with 40 watts of drive once or twice.

>
Craig,

In oak.oakland.edu /pub /hamradio /mods I found:

"
The pins 38,39,40,41 near HMCS45C are used for extensions.
You'll probably have to use pin 41.
The frequention range will be: 144-148
Your steps will be 12.5 and 25 kHz, 1000 and 100 Herz
The shift will be 600 Hz.

By using pins 39,40 and 41 the whole story will be the same, only your steps
will be 5 and 10 khz, 1000 and 100 Hz.

"

I hope it works out.
I'll try to mail you the whole file.

Good Luck!

>Larry, KE8GW

Larry,

As a former Customer Service technician at Icom, used to answer over 1200
phone calls a month there, try to give some information about the noise.
Where does it come from ? ,
Engine running or not, can you record the noise ?
Maybe it is the alternator, not the radio ?
Have you tried the radio at anothers station ?
Does the noise get worse with the antenna attached ?
If the key is on or off with the engine not running is the noise there ?
Could it be the electric fuel pump ?
Can you hear the noise when it is attached to a power supply in the house ?
Where is the power cable connected to ?
Do you have the power cable plugged into the cigar lighter ?
into the auto's fuse block ?
Do you notice the noise when sitting still or just when driving ? (wheel
static)
Have you tried another radio in you auto ?
Is the noise there ?
All of the above will help Icom find the trouble. Remember they use only a
test bench, never install the radio into a car and drive around.
I have owned a 2410 even before you could buy one, never a problem in my 1986
S-15 pickup, also the truck is bonded for H.F. operation.

You also might consider sending along a cassett recording of the noise so they
may hear what you hear.

Just remembered .. does the noise clear if you cycle power on the radio or remove the voice synthizer, sorry just forgot the part number for that. If so then it is the voice syn as there is a mod for those. Check it out.

I think Kevin's last post on this subject explains
everything. He has sympathy for the cops because
he is a closet Hamster Cop. There is no legitimate
reason, blah blah blah. There are many legitimate
reasons for mods. I carry a HT that has been opened
up when I go into the wilderness alone. I know the SAR
frequency and would not hesitate to use it to help them
find me. If it is my butt that is plenty legitimate for me.
Additionally there is MARS CAP and other Government useage
that does not require type acceptance. As to the comment that
this doesn't apply to HF what nonsense. With an open HF I can
step on broadcast bands, maritime bands, transoceanic aircraft
bands and do it world wide. What we really need is more
restrictions on what we can buy or do. Kevin do you like the
ECPA and its spawn? If things were your way there would have to
be a whole subset of radios just for the US with a associated
rise in price. Enough for me. Have a happy Holiday everyone.

RANDY>> ... [Radio Shack's HTX-202s are} very fragile,
RANDY>>and are even damaged when turned off, as my friend made it a
RANDY>>habit to turn off the HT while using hf, and it still took out
RANDY>>the front end.

This is contrary to hundreds of User reports I have read over the past year. There must be something else going on with your "friend's" setup that we don't know. Blowing up Icom/Tandy-designed HTs when they're turned off in the manner you describe is quite bizarre.

MERCADO>> I passed my Technician license last saturday.

Congratulations! Expect just a 4-5 week wait for your License. HOWEVER, you can call the FCC in about three weeks, and get your License Number - and go on the air!!!

MERCADO>>What brand of HT...Single or dual band...Mail order or
MERCADO>>local, mobile or HT ...

Number One: Join your local Amateur Radio group.

You will better define what your needs are - and what's available to you locally - by interacting with Members of the group. Makes no sense at all to purchase equipment with bands that are of no use to you!

A wealth of information will be gathered from the group.

I am fortunate to live in Southern California, where a mere watt or so could "hit" about every repeater I need. See what is happening locally, and then you'll be better prepared to make that equipment purchase!

Buy local or mail order? Well, I perosnally like to hold things in my hand before purchasing. I have established relationships with local dealers. I can return an item I'm having problems with, and get replacements immediately. And, under most circumstances, prices will be close to mail order. SERVICE is tantamount to my purchasing decisions.

Message-ID: <3dfhp7$imu@crl2.crl.com>
Source record: 221612

Anyone out there have the pinouts for the AZDEN PCS 4000 2 meter radio?
I would like to use this radio for packet but the manual doesn't show
which pins do what. Anyone out there who could send along the 8 pin
information for the mike? It is a circular jack with 7 pins around
the outside and one in the center... Looks like a Kenwood but
the Kenwood mike doesn't work so the wiring must be different somehow...

Thanks

Hello to all:

This is my first time on this group so please forgive me if this question is best sent to a differnet area or if the answer is in a FAQ that I have not yet found.

My Dad has purchased an ICOM IC-2GXAT HT and has been told that it will recieve outside amateur band if a certain key sequence is made while powering on/off. He is also interrested in TX mods but that is of secondary importance.

If you have some information on how this can be done or if you know of a WEB site or FTP site where the info might be located please post it and send a copy to my personnal account address as well.

Thanks in advance for the help.

Doug

>>so the user can stand back from it while holding the set?

There is another option which I haven't seen anyone mention yet:
A good speaker mike. It allows the radio to be kept at arm's length.
The Radio Shack speaker mike is a pretty good one (in my opinion),
because it has a fairly large speaker that can output high levels
of audio, whereas some of the smaller "mini" types are useless in
anything but a hospital zone.

>By far the best approach is to eschew the HT and use a mobile rig

6740. Kenwood TS-430s: slow start

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-24 02:02:36 UTC
From: tyson@cpcug.org
Message-ID: <3dfvfs$83d@news1.digex.net>
Source record: 221762

I have a Kenwood TS-430s, bought around 1984. Within a year
of getting it, it developed a problem with there being very low RF
receive until it had warmed up for an hour or two. After that, it
was fine.

Circumstances prevented me from even thinking about this problem
until now. Now, the problem is still there, but worse. When I turn it
on, it's as if there's an attenuator between the coax connector and
the antenna. Then, slowly, over a several hour period, the RF slowly
rises until reception is correct.

I found some mods and fixes over on oak.oakland.edu, but nothing
looks similar. Has anyone encountered this problem and/or fixed it?
I went through a while ago and cleaned everything that looked
dirty. But, it didn't seem to do any good.

Well, this is obviously a thermal problem, Herb. You're going to
have to use old fashioned troubleshooting to find it. Likely, some
component in the front end has become temperature sensitive with
age. Let it warm up, then use freeze mist on components in the
RF front end until you find the one that drops the sensitivity of
the receiver when you spray it.

It may be a B+ decoupling capacitor. Take a look at the collector
voltage of the front end transistor when the radio is first turned
on. If it's lower than what the schematic calls for, start checking
the power rail decouplers.

6750. Radio for amateur and commercial

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-24 15:41:00 UTC
From: jpuckett@cc.weber.edu
Message-ID: <24DEC199408413740@cc.weber.edu>
Source record: 221769

If you require a handheld tranciever with both amateur and commercial bands on it, there is one possibillity. Motorola makes the RADIUS P-200. It can be programmed by a local service center for both a commercial and amateur frequencies. There are limitations, many. but if the freqs are within 10 Mhz of each other such as a repeater at 444.xx0 with TX at 449.xx0 then you should be able to also have a 457.xx0 comercial repeater programmed. These units are FCC type certified and must be programmed by an authorized motorola service center. (NO FIELD PROGRAMMING) The thing most likley to cause problems is convincing the technician that the radio is capable. I use an HT-600 (about the same as the P-200 inside) and it took reading the service manual for the allowed split and band width. The old Motorola Handhelds could not have any recieve freqs more than about 2 Mhz apart, this is no longer so but many technicians do not seem to know about the product inprovment made in the last 10 years. The limit on wide splits is now the transmitter.

Please don't take my word for any LEGAL questions about this. My radio is programmed only in the HAM bands (I have no need for commercial) but the service center (they have a license) told me that with this radio it was legal to be used on the commercial freqs. (EMS, and so on)
The radio is not cheap, but it is just about indestructable.

6751. Yaesu vs Kenwood

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-24 16:59:42 UTC
From: pmm@safn2.saf.com
Message-ID: <792@safn8.UUCP>
Source record: 221772

I upgraded to advanced last weekend and extra last night. One
big problem: my radio is a 1960's novice rig.

I have done a bit of shopping. My budget is about $1,000 and since
I am American, I exceed my budget. Therefore, I am looking for
a TS450S or a FT890. The prices are roughly equivalent.

I want the hottest receiver I can afford for $1000 - 1200 for chasing DX
on HF. (Antenna will be phase II -- this summer.) I plan on
buying the 500 Hz CW filter for either rig. I will be operating
CW and SSB, 50/50.

Anyone have any advice on how to choose between them? I want it
bad and I want it soon....
Are there differences in the quality of audio, in their
respective serviceability or in their ease of use? I've been to
the local HRO and talked on various 1-800 lines, but what do actual
users have to say about this equipment. Any feedback, qualitative
or quantitive will be much appreciated.

(I know I haven't contributed to this newsgroup before, so I shouldn't
expect everyone to help me out. I just started getting the newsgroup
a few weeks ago and have been lurking. I promise I'll add my .02 when
I have something to add, until then I'll lurk.)

Thanks in advance.

I'm curious. What makes you think this is a defect? In my mind it is a
benifit. It allows the characteristics of the radio to be modified in the
field. With a 10 year or so battery life you will probable only change it
once or twice during the lifetime of the radio.

I have one of the radios on your list. Icom has told me in the past that
they will replace the battery for a very inexpensive price. I remember it
as being under $30.00 but am a little fuzzy on that.

You replace the battery in your watch, smoke detector, flashlight, car,
etc., much more ofter. None of them work when the battery goes dead either
yet you don't say they are defective.

If you are "brave of heart" you can turn your radio on and then replace the
battery without loosing memory.

>>
>I'm curious. What makes you think this is a defect? In my mind it is a

It's a DEFECT. Period. A device that has a wear item which when failing causes the rest of the device to fail is DEFECTIVE. Have you ever encountered a VW Rabbit Diesel? If the timing belt (a wear item) fails, the valves hit the pistons and voila, no more engine. That's DEFECTIVE.

THE BATTERY IS A WEAR ITEM. THIS MEANS IT IS CONSUMED. WEARS OUT. WHEN A WEAR ITEM FAILS, IT SHOULD CAUSE NO OTHER COLLATERAL DAMAGE.

>benifit. It allows the characteristics of the radio to be modified in the
>field. With a 10 year or so battery life you will probable only change it
>once or twice during the lifetime of the radio.

True, that's the idea behind this design. Because it's such a successful strategy (i.e., icom couldn't write firmware worth a damn so they took this approach), they never did it again after that generation. I doubt any other vendor did it either. Some benifit.

>
>I have one of the radios on your list.

I'm sorry to hear that.

>Icom has told me in the past that
>they will replace the battery for a very inexpensive price. I remember it
>as being under $30.00 but am a little fuzzy on that.

That's the least they could do. Have you ever heard of "orphan" radios? Orphan radios are made by companies that subsequently went out of business. Even ICOM may not last forever.

>You replace the battery in your watch, smoke detector, flashlight, car,
>etc., much more ofter. None of them work when the battery goes dead either
>yet you don't say they are defective.

Each restores it's origional function (minus volatile data settings) when battery is replaced. These are not defective. THE ICOM IS DEFECTIVE for the reasons noted above.

>If you are "brave of heart" you can turn your radio on and then replace the
>battery without loosing memory.

Yes, this is a published workaround.

Good luck.

Congratulations! Welcome to the ommunity. I have had my license for about
4 months. What fun I am having. HAMs are a great bunch of folks.

I purchased a Yaesu FT530 dual band HT for my first radio. I wanted the
use of 2-meter and figured I would be interested in 70cm sooner than
later. I was right, although I don't use it right know that much. If I
plug a cig lighter adapter into the radio and use a auto based antenna
(or house) I have NO problem working simplex or repeater. It has been a
good radio - I feel I got my moneys worth. The radio does seem to have a
little intermod. I have quite a few friends that have other brands
including the Radio Shack. Radio Shack has a pretty good price pn their 2
meter HT and everyone that I know that owns one seems to be quite happy.

I would recommend that you join a local club. That's what I did and it
really helped to get integrated into the HAM community.

Best of Luck!

: I believe in buying USA whenever possible. More importantly what USA
: *owned* companies make HT's (versus made in USA by Japanese companies)?

: If HT's are like TV's and VCR's there may not be any USA made HT's?

: What HT's are made in the USA and are they decent enough to buy?

I find I am no longer able to purchase US made radio equipment capable
of receiving or easily modifiable to receive cellular frequencies. But
I am able to import them under the law permitting "importation of non
FCC certified devices for personal use in quantities not exceeding three
units per shipment".

If you want an HT with FULL 800 mhz range, I recommend you go overseas or
Canada to insure the full extended range. The US market has lost my sales.

Don,

Icom never made an optional Pl encode or decode circuit board for the IC-25 A.
It is recommended you go to Communications Specialists for the PL board. You
will probably need to mount a dip switch for the PL board some place.

6760. RS Extended Warranty for HTX 202

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-24 23:28:49 UTC
From: sdulaney@imtn.dsccc.com
Message-ID: <3diarh$fju@tpd.dsccc.com>
Source record: 221781

I am looking for advice on the need to purchase the extended warranty from RS on a HTX 202. I've seen post suggesting to buy it. Other people including a friend who has one have never had a problem. Being in the electronics field, most infant mortality happens within the first 60 days. I do plan on "burning-in" cycle just for this problem. I am looking for information related to any other problems people might be having.

The saleman said that since my radio is a x-mas gift, I have 30 days to purchase the warranty.

Any comments, please post here or e-mail me at "sdulaney@devel.dsccc.com"

Thanks

If you're serious about owning a USA-manufactured HT, look for a used Ten-Tec 2-meter handi. They've been discontinued for years, but at a hamfest might just find one.

An alternative would be to purchase a USED Japanese HT. Since the unit has already been purchased by the original buyer, you are not creating a new sale that would benefit a foreign country.

Happy holidays from K4ADL

PMJI,

Also there are no requirements for emissions for handhelds under 7 watts of
R.F. power. So manufacturers will never make handhelds over 7 watts of

transmit power as more RFI requirement satndards must be meet.. The EPA sets forth the RFI requirements. This may change if the F.C.C. does decide to require amateur stations to meet the same radiation standards that commerical broadcast stations do.

You don't want the *hottest* receiver, they all have too much
sensitivity anyway. You want the *strongest* receiver. Just go
buy a TenTec and get it over with.

The IC-25A most certainly *does* have a PLL. It is a frequency
synthesized radio. Perhaps you are looking for a CTCSS encoder.
Icom didn't offer one as an option, but Circuit Specialists
makes a nice little one that will fit inside. If you need more
than one CTCSS tone, they make a bigger one with a selector knob
that comes in an external box that'll interface through the
microphone connector.

You're right that most infant mortality should be caught by the normal
factory warranty. However, their extended warranty will fix your rig
even if you *drop* it or plug it into the wrong voltage and fry it.
The regular warranty won't. The extended warranty is basically an
insurance policy.

Well, here's how it goes: If you are at a base location (your house, dorm, whatever), you can have a radio capable of listening to anything in it. If you're mobile or portable, I beleive the law varies state-by-state. For example, when I lived in Michigan, you had to be a peace officer or ham operator to have a out-of-band radio, but here in Texas, there are no laws for it. I guess it depends on where you live.

I'll follow that up with something...

Type acceptance, as far as I gather, is only necessary to sell a radio. My radio's been through repair stores and Kenwood itself and come back still modified. However, if a person (I think it's only dealers for that matter) sell a radio that has violated type acceptance, then it's not good. Now, if you haven't transmitted out of band, you have nothing to be worried about. I was talking with a police officer one day, and when both our radios happened to receive the same thing (hint hint), all the police officer did was ask why I had that on, and I said that I was a ham operator. In response, the police officer said "I didn't know about that, but okay". I mean, c'mon here! Yanking your radio away just because it COULD receive and/or transmit out-of-band is ridiculous. However, just to be on the safe side, I'd check your university's rules and regulations just to see if they don't have anything hidden in there to the contrary.

I found a used Kenwood TS450S locally and picked it up yesterday.
Works great. I made my first SSB qso in ten years just now.
Many apologies for cancelling my first post so quickly....I didn't think I
would wind up with a good deal so fast.
73 and happy new year.

6789. HAMCOM & JVFAX ftp sites

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-26 04:36:09 UTC
From: copeland@fohnix.metronet.com
Message-ID: <3dlh7p$lua@fohnix.metronet.com>
Source record: 221708
Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave

Several people were interested in the shareware JVFAX and HAMCOM, so
I did a archie to find the anonymous ftp sites that carry these, and
here are the results.

HAMCOM is a program that interprets CW,RTTY,SITOR, and AMTOR from
a shortwave receiver connected to a PC. It comes with schematics
for a very simple $5 interface made with Radio Shack parts.

JVFAX is a program that uses the HAMCOM interface hooked to a shortwave
radio. It interprets WEFAX,SSTV, and about a dozen other FAX formats.

The HAMCOM interface connects to a shortwave radios earjack and a PC's
serial port. It uses the serial signal DSR to transmit information
to a PC (creates hi-speed interrupts).

You need a 386 or better computer to use these programs.

Message-ID: <3dlojo$t7q@cello.gina.calstate.edu>
Source record: 221617

I am trying to connect my Kantronics KPC-3 TNC to my Radio Shack Realistic HTX-202. I am looking for the correct hook up. If anyone could supply me with the correct information, or tell me where to get it. Some information on the KPC-3 is below.

KPC-3 (db-9)
1. Transmit Audio
3. Push to Talk
5. Receive audio
6. Ground

Radio Shack HTX-202
One Microphone connector and
One Speaker Connector

Any suggestions?

Thanks in advance.
Todd Hansen, KD6YPS

6794. Icom 02-AT lithium battery dead?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-26 13:16:15 UTC
From: jbdaniel@facstaff.wisc.edu
Message-ID: <jbdaniel.33.000D45C7@facstaff.wisc.edu>
Source record: 221717

Hey ho-

After 5 years of extremely faithful service, looks like my 02 is having its first problem. I turned it on and all of my memories were gone, the vfo was set at 140.00, the "beep" was turned back on, and finally the little "u" was lit for PLL unlock (wierd).

I guess this is probably the lithium battery. Has anyone out there replaced one of these and/or know what type of battery to get? Are the symptoms described indicative of lithium battery death/failure?

I'm asking all of this b/c my instruction booklet is buried somewhere in my mom's house 1000 miles away.

thanks and 73,

N2JLL, Josh

HI, I can't remember where I signed up either, but i know I did cause
I got the confirmation message. BUt that is the only thing I have ever
received from the group. And that has been a couple o months now..
Has anyone noticed any different? I will search and see if I can find
the listserver again...

I know, not the best place to post this query (if you know the correct one please tell me). But does anyone know if the newest low-level orbiting weather APT satellite got launched yet? It should be NOAA-14. I've not seen it in the orbital data yet by that name.

Have a Kenwood TM741A with 2M and 440 boards. Haven't used the rig since summer of 1992 and can't find my manual! Can't remember some of the scanning and other functions.

Anyone familiar with this radio who could help me out? Local ham store didn't have a manual for the thing. Thanks!

From: fresaint@bb.iu.net
Message-ID: <D1Fu9K.7tr@zeno.fit.edu>
Source record: 221720

Inventory is complete, tube tester is an old GE, which doesn't work due to insulation rotted on power cord, so these tubes are not guaranteed.

Wide, I mean WIDE selection available, but don't have any 6LQ6s or 6JB6s. Email me with your shopping list, and I will do a search for your tubes of choice in my database.

There are over 600 tubes in my database/inventory, so don't be shy about asking for some obscure thing that you think isn't around any more. I have everything from RCA, Philco, Westinghouse, Tung-Sol, Zenith (some from Holland), metal tubes, Cunningham, Admiral, Magnavox, Sylvania, etc.

Please give me a shot. Thanks

Hmmm ... going by what you say next, this is a *TS* 700, right?

> It is a all mode 2mtr transceiver with VFO, so it has no frequention display
> but it has analog tuning.
> Does this have some advantages?

Well, the LO phase noise from the VFO is/will be considerably less than that generated by the FT290 synthesizer :-)

>
> What will the performance be compared to a Yeasu FT290 (with ampl)?

A TS700 I would take / have taken to a mountain top site for use in a VHF contest. An FT290 I would bury and forget. This, of course, is entirely subjective, but the strong signal handling capability of those radios leaves *much* to be desired, even on FM .....

> I want to buy a all mode trans. and these two are offered to me. I dont know
> which one is best. But the FT290 is much cheaper (and newer) as the
> Kenwood. (650 vs 900 Dutch Guilders).

You'll have to balance for yourself between the 'all in one' TS700 with mains PSU and the 'bits' solution afforded by the FT290/amp/12V PSU scenario. I can't help you further, other than to say that, for use in the shack, I'd personally rather the TS700 ANY DAY!

6810. Kenwood TM-733A bugs

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-27 02:51:25 UTC
From: lynch@bluto
Message-ID: <1994Dec27.025125.8678@newsgate.sps.mot.com>
Source record: 221730

I have been having two very annoying problems with
my Kenwood TM733A. First, if I have selected the
carrier activated scan resume mode (as opposed to the
default time activated mode) and I send DTMF tones
to dial a number on an autopatch, the carrier activated
mode is cancelled. Second, from time to time after
I have pushed the power off button, the remote display
goes off but the radio itself does not! Plus, when
you push the on/off button again (to turn on what you
believe to be an off radio) the display remains dead.
The only way to rectify the sitiuation is to momentarily
disconnect the main power source from the radio so
it can do a reset.

I have discussed both these problems with the Kenwood
service center. They said they knew of the second
problem and were working on a fix which could then
be implemented at authorized service centers. The
guy I was talking to, however, was not so sure about
whether or not the first problem was widespread.

Has anyone else out there experienced these problems?
If so, have you had any success in getting them corrected?

Thanks,

Scott Lynch

Source record: 221731

I own a Kenwood TS-130S transciever, manufactured in the early to mid 80's, and it has just been a wonderful rig. (great signal reports, extremely durable, etc....) Anyways, I am getting very sick of normal SSB communications and would love to get into some of the other HF modes such as RTTY and 300 baud packet. I was looking into the purchase of a KAM+, because I could then use it with my 2m HT for 1200 baud packet.
I don't have a problem hooking it up to my HT, but my HF rig is presenting a problem. The TS-130S has a 4-pin mic. input, (there are no pin references available to me, so anyone who has those, it would be greatly appreciated) and a very peculiar 7 pin "ACSY Remote" jack on the back. Anyone who has any information on how a multimode controller could be hooked up to this rig, please respond to my e-mail address. Thank you in advance! 73's........

> got a TNC I want to use! (KPC-3). The kantronics manual is not explicit
> as to which circuit I need, they did not supply necessary parts for many
> HTs.

Here is the circuit that I got from the SMC-33 Remote Control Speaker Mic
and the TH-79 manual:

2.5 mm stereo plug (hard to find!)

tip: speaker +
inner ring: remote resistor sense (3.9K = sw1 (to gnd)
10K = sw2 "
27K = sw3 "
short = lock ")
outer ring: gnd

3.5 mm stereo plug

tip : mic bias (normally unused)
inner ring: mic +
outer ring: PTT (to gnd)

Note that the schematic for the SMC-33 has an error showing the mic gnd
connected to the PTT signal, rather than to gnd as is shown in the TH-79
manual.

Hope that helps!

It seems that we have a lot of amateur lawyers, as well as amateur radio operators responding to this post. It's easy to see why - because it is infuriating to think that some hot-shot lawman can walk into your life and take your stuff without so much as a how-do-you-do. It torques me off just thinking about it. The problem is that we have a lot of qualified opinions and not so many facts. Here are the facts that I see:

1) Per the FCC, there is no federal law against owning a radio which can receive and transmit outside of amateur radio bands. There may be state and local regulations which prohibit where you may use such a radio, or who may own such equipment however.

2) Using any kind of RF equipment to transmit on a non-ham band may be a violation of law under most circumstances. I have seen anecdotes which indicate that under emergency circumstances it may be legal to broadcast on police/public service frequencies, but that is very touchy.

3) Dave doesn't indicate if the police have evidence that he was using the radio illegally. This would seem to be key. If they have such evidence, there may be justification for some kind of action on their part. Without such evidence, it sounds like they were just on a fishing expedition through his dorm room.

The most sensible advice I have seen so far is for Dave to get further advice from legal authorities. The ARRL, ACLU, and any local legal aid services may be of help. It would seem that if there is a fundamental violation of civil rights here, there would be some amount of compensation and publicity to be gained from persuing this, which might well interest an attorney.

Lets face it folks: With RICO laws becoming commonplace and our rights granted in the Bill of Rights being usurped at every turn, we have to challenge this kind of nonsense anywhere it happens. If you let them have an inch, before long they'll take a mile

Kevin,

I think you should ask youself what *is* amateur radio before
posting in amateur radio groups.

A simple reason for having VHF radio out of bands:

- operate a transverter

Another one, which is cited occasionally:

- carrying only one radio when delta gliding. Here the argument
with the type approval holds, but in practice it does not seem
to matter to much.

Comercial uses of HF radios? well, there are enough people who
desire to stay in contact with relatives a few 1000 miles away,
and if telephone lines are unstable, not available or to expensive,
they just get HF radios..(and can become quite a nuisance)

Helene Maxwell (hmaxwell@netcom.com) wrote:
: My questions are:
:
: 1) Should I avoid handheld units completely, except in perhaps
: for emergency use (this is an option I could live with).

No, but just be aware that there MAY be some risks attached to portable operation.

: 2) Are handheld units reasonably safe at lower frequencies?

Power level should be more of a concern than frequency.

: 3) Are there any handheld units that allow the antenna to be detached
: so the user can stand back from it while holding the set?

MOST handhelds use a standard BNC connector that allow you to disconnect the antenna, allowing you to attach a cable to a remote antenna. A while back I saw a cable set-up for sale that let you clip the radio to your waist, and clip the antenna to your hat (not quite what you had in mind I expect :-)). Another option is to get a speaker/mike (available for MOST handhelds) that lets you have the mike, and a small speaker close to your face while keeping the radio several feet away.

: We've all heard the story about the woman whose brain tumor was
: blamed on her cell phone. Any advice greatly appreciated!

Well, the facts are not fully in, but yes, it appears there MAY be a link between radio transmissions close to the head and some cancers. I would not pack up the handhelds right now, but some caution is warranted.

6826. R.S. 2m amp ... serious restriction???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-27 16:57:24 UTC
From: o10022@a81.corp.mot.com
Message-ID: <1994Dec27.165724.10584@schbbs.mot.com>
Source record: 221596

Yesterday I bought a Radio Shack 19-1122 2 meter amp, and promptly returned it. Here's why:

I'd checked the spec sheet at the store, and what I saw looked good (as far as it went). When I got it home, I read the entire short owner's manual, before I even took the equipment from the box.

The manual at one point says that a high SWH can damage the equipment, and there's no surprise there. Then, on page 12, it says that the SWR must be no higher that 1.3:1 to be "acceptable".

Since the antenna system not uncommonly results in a SWR of perhaps 2:1 as one transmits at various frequencies within the band, that would exceed the "acceptable" level mentioned in the manual. (Yes, I know most antenna manufacturers claim 1.5:1 or better across the full band, but I believe in Murphy's Law much more than in advertising claims, and even 1.5:1 would exceed the "acceptable" max of 1.3:1.)

The clerk as R.S. could not tell me whether the "1.3:1" was a genuine "maximum" for the amp, as was implied in my reading of the words, or was merely a "recommendation", or whether reliability/performance begins to suffer at even slightly higher SWR's. (At least I was fortunate enough to find a salesperson who knew what SWR is!).

Have any of you good readers any information which might lead me to believe that the quoted "1.3:1" is excessively conservative? Or, have you recommendations for other modest-cost amps, such as the frConcepts model rfc-2-23?

From: dara@physics.att.com
Message-ID: <D1HBuz.CKD@nntpa.cb.att.com>
Source record: 221597

I found the chasis of my RS20A was at 13.8V. The Triac mounting
stud was touching the cabinet. It is at 13.8 V and is normally
isolated by two mica washers. That works only when the stud is
centered in the hole, but mine had moved over and the stud
touched the side of the hole. I discovered the problem when
using it with grounded equipment. I melted the insulation on
the ground lead. It was easily fixed by moving the stud.
Any one else seen this problem? And is there a better washer
that prevents it from shorting?

I built one of their SW receiver kits a year ago. It was fun to solder
together, and it works okay for what it cost ($30.00). Remember though,
you don't get what you didn't pay for. The basic design of the circuit
that I built has some problems, so the performance isn't optimum. Also,
there were a few missing components - good thing I have a decent junkbox.

I would probably build another Ramsey kit, but not for equipment that
must perform to the best specs - more as a lark.

I presume that this is a "legalese" safeguard, and the amplifier will withstand much abuse. Personally I would not buy any amplifier that would not withstand a temporary short or open because such situations eventually happen. Since RS allows you to return the amplifier, I would test it into the open and short for a short time (1 sec). Then I would return the amplifier if it would not withstand the test.

Michael,
All I can tell you is my experience; I didn't think their transceiver worked, so I sent it back, they said it was OK; never made a contact with it. I would personally not buy one of their kits if I intended to go on the air; Personally (and this is just my opinion), I would buy an Oak Hills Research kit, or join the NorCal group and get their new NE40 for about $100. I know this seems like a lot, but $100 is about what it costs to really get on the air. Maybe get an old used rig for $300, too.

Well, the battery in my ICOM O3AT (about 6 years old) has finally died. (It's the small one that came with the radio -- I don't remember the number.) I guess I left it turned on one too many times. Won't hold a charge at all. Open circuit voltage is around 5.5V after slow charging for 12 hours.

What is generally recommended? Throw it away and buy a new ICOM battery, or brand X? , or re-fill it, from where? I'm in Sunnyvale, if you have any retail recommendations.

I've heard it's possible to restore the battery. Is it a simple process?

(Oh yeah, I'm talking about the power pack, not the internal battery that holds the memory.)

Thanks.

Source record: 221614

QST had a very good article about the 850, July '91 I believe. Basically
the article said the 850 has the best receiver on the market, nothing
else even comes close (for the money). The only bad point was that the
3rd order distortion products where only 28 dB down, 2nd and 1rst were ave.
In my opinion, unless you put a linear on it, this won't be a significant
problem.
It does have computer hookup/programming with an optional box and can do
all the dgital modes, with TNC of course.
I'll tell you more later via e-mail if you wish, my 850 should be here
any day ;-)

You can get a little more life out of an old Nicad by "zapping" it with
a high power 12v supply like an Astron. When the battery pack in my
Icom 2SRA started to go, I found that zapping helped it a little. But
not much. Within a few more weeks, it was just as quick to lose a
charge as ever.

At the Boxboro Massachusetts ham convention I ended up buying several
new batteries from Periphex in Oxford, CT (ph 800-634-8132). There
were quite a number of battery suppliers there but the Periphex products
seemed to be much closer cosmetically to the original Icom batteries
than any of the others. There prices were a tiny bit higher but seemed
justified by the cosmetics. (A couple vendors' products had what I
considered rather poor cosmetics that wouldn't fool anyone.) The
Periphex batteries were about 1/2 what Icom charges.

What I also bought from another vendor was a case that holds 6 AA
batteries, which I filled with some ordinary AA Nicads I'd bought
for a buck each at the MIT Flea Market last summer. That case
cost me about $10 I think. I think the guy selling them was calling
himself "Dr. Nicad" or something silly like that.

On the whole, I'm quite happy with both these purchases. It definitely
is not necessary to spend the kind of money Icom charges for a battery.
You do not have to sacrifice cosmetics if you pick a good vendor. But
in hindsight, I think the case that holds ordinary AA cells was probably
the better purchase since nicads _do_ have a limited life and when
they go, if they're sealed into a pack, there's more to throw out.

6842. Mobile transceiver for HG/PG recovery, advice please

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-28 06:40:19 UTC
From: first.ascent@mindlink.bc.ca
Message-ID: <3dr18j$otj@deep.rsoft.bc.ca>
Source record: 221620

I'm looking to get a mobile transceiver for a hang gliding/paragliding recovery vehicle. USGHA frequencies are 151.625, .925 and .955. In Canada, those are commercial frequencies and strictly speaking one should use the 123.4 AM aircraft band, but most people use USGHA anyway, or somewhere in the regular ham band. The appropriate models at my friendly neighborhood dealer are:

Alinco DR-130
Icom IC-281H
Kenwood TM-251A
Yaesu FT-2200 and FT-2500M

of which he recommends the Kenwood, and since it looks like that's the only one that receives aircraft, I'm inclined to agree.

Anybody have any comments on these particular models, or any alternative suggestions? Or any useful advice in general on vehicle installations?

I believe this is a case of tech writer failure, not amplifier
design failure. Knowing the likely usage of this amplifier, no
designer is going to require a 1.3:1 or better match or risk
final destruction. If there is any validity to this recomendation
at all, it's likely to do with the *receiving* helical filters.
A high SWR can degrade the frequency response of the filters.
Since most amps don't even *have* filters, a degraded response
here is likely still better than the performance you'd get from
other amplifiers.

Sure, what you want is a *shoulder* washer. It has a step that
fits down in the hole. That'll keep the stud from wandering into
contact with the chassis. Since the triac isn't normally conducting,
and only serves to crowbar the supply in the event of an over-voltage
condition, the loss of heatsink from using a shoulder washer isn't
critical. Still, I'd use it on the nut side rather than on the diode
body side so that the mica washer on that side can continue to give
a good thermal path.

None of the radios you mention would be legal in the US to use on the
itenerant frequencies listed because they aren't Type Accepted for
that service. Motorola, Tait, Johnson, Maxon, and others all make
legal radios for that service. (You would need a commercial itenerant
license for any of them.) I don't know the Canadian commercial rules
very well, but I'd be very surprised if they allowed amateur rigs to
be used in commercial service.

Well, I would like to say is was a real boar anchor, but in true reality
they are collector items which I would like to have, but alas, have not
a dime to spend on such things. Don't be to hastey to sell it for small
dollares and do not throw it out with the trash. They are getting to
or they are collector items.

Th> Don Thaxton - N0FGK
Th> E-mail thaxton@ptgroup.com

Don, I own an 850 and for the dollars...you cannot beat the thing. I am
a contester on CW, Phone and RTTY. I have beat mine to death and it still
goes and goes and goes...much like the Engergizer Bunny. Hook ups are great
for packet and amtor and rtty. Has a superb RF speech processor and the
receiver is excellent. Has a good receiver with all the bells and whistels
you would expect. I suggest that you get all the filters for CW and SSB
On SSB, you can get a 1.8 Khz filter and get some better selectivity rather
thatn the 2.4 Khz flter. I have them all. I got the FoxTango filter set,
not the Kenwood filter set because the are a better filter, BUT, they are
a real trick to install them. I wold not recommend that to you, unless
the Fox Tango people install them. It is tricky. With the Kenwood filters
which are adequate, the filters just plug in in a small hatch on the bottom
of the case. Real cool. Get an Astron RM 35 power supply too. Also, get
the tuning unit. I use it from time to time, but I have converted all
my antennas to open line feeder, so I use a tuner with a 4:1 balun. Works
great. I've knocked out over 10,000 QSos with mine and no troubles.
The receiver is better than the 950...and Kenwood redesigned the 950 with
elements of the 850 receiver. Let me know if you need more.....

I am sure you have gotten a lot of mail on this issue....

I like Kenwood over Yaesu.... Kenwood is pretty good stuff since I have owned a lot ofit. Yaesu is well known to, but I don't like their layouts and the way they label stuff. 11 meters is still a large chunk of thier business.

The comments on TEN TEC.... yes, they are good...expensive...American made which is something to thing about, but they are pricing and some of the features on th OMNI VI are not as good as the Japanese rigs. The PARAGON is the best, but it is 2195 direct. Enjoy my opinion

6852. Kenwood TH-79A (Deluxe)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-28 17:18:19 UTC
From: ojg@tis.inel.gov
Message-ID: <3ds6kr$4mm@mica.inel.gov>
Source record: 221619

Well, Kenwood has now advertised the "Deluxe" version of the TH-79A which
will have MEMORY CHANNEL LOCK-OUT (SCAN MODE) and a WIDE-RANGE FLEXIBLE ANTENNA.
I talked with Kenwood USA yesterday and asked if they were going to do anything
for those of us with the "early" version of the Th-79A. NOPE! Nothing!
They (Kenwood USA) knew that this was going to create problems. Their
relief for those of use who own a TH-79A (not Deluxe) is if you contact
them, they will send you a coupon for $20.00 off your next Kenwood product.
So, there goes any hope of Kenwood upgrading the original TH-79A. Other than
this missing feature (which was in the original sales flyer which was quickly
recalled) the radio is a fine piece of equipment. In talking to HRO in Denver,
they do not have the "Deluxe" version in yet.

Its too bad Kenwood isn't going to do anything else.

Anyone heard anything about the new Yaesu FT-51R?

From: les@ripco.com
Message-ID: <D1J73u.4qM@rci.ripco.com>
Source record: 221630

As a followup to this,I thought I should pipe in. Trained as a biologist, but working as a DDS, I've had a personal interest in biological-RF effects, and as mentioned the jury is not in. There was a wonderful article in 73 Mag about a year ago on the House meetings re this issue. It was presented by an MD researching this topic, and this article was an exerpt of the transcripts presented there. It was very technical, but had substance. You may want to look it up if you know this field, or have some good reference books and time to distill the info.
The bottom line is this: as the freq. goes up, the permissible field intensity becomes more damaging to the cellular components(not phone) ie DNA, and is therefore lowered to prevent this. Certain uwave freq. are actually resonant with DNA segments, which you can imagine the catastrophic effects. This has been demonstrated in bacterial cultures. Another important point is that thresholds mean nothing. It's arbitrary.Even seemingly small exposures have some effects, and worse, the doses we've been told are okay, aren't.

Something to think about. Personally, I refuse to use a handheld cellphone based on the biological effects, prefer to use my VHF HT with an extension mike, or better, an ext. antenna, and stay away from leaking uwave ovens. And, not to give some lawyers ideas, I see the day when hams will get sued for their "menace" to the neighbors.

I. I see no one has yet responded to your query so I'll take a shot at it.
I would agree that it is likely to be your lithium backup battery going
out on you.
I own the similar IC03AT and an IC32AT. I had my lithium battery replaced
in my IC32AT, but have not yet in the IC03AT.

Although I had the IC32AT's lithium battery replaced, I suspect the
problem I had (with the similar symptoms you're experiencing) was from
either:
1) a loose connection to the lithium backup battery
2) the radio resetting upon switching battery packs while the radio is on.

After getting the radio back with the new battery installed, I tested the
old battery, which was also returned to me, and found the battery was
still good at 3 volts (tested with a load applied too).

Also, I switched battery packs "hot", with the rig left "on" and again
experienced the rig resetting itself.
Anyway, I have not experienced the rig resetting itself again since
changing batteries packs with the rig turned off first.

II. I had a local (Robert Hall Electronics, San Jose, CA) repair shop do
my work on my IC32AT. They supplied the battery. In the IC32AT, it was a

lithium disk-shaped battery ~3/4" in diameter. The old lithium battery was returned to me although I since gave it away to a friend who suspects his IC2GAT's lithium battery is going out. It appeared to have had tabs spot welded onto the front and back at one time. I don't know if the IC32AT uses the same battery as is in our IC02AT and IC03AT.

III. As I recall, the little PLL unlock "u" also comes on when the attached battery pack is just about to go dead. My manual is also not with me at this very moment so I am unable to quote the exact ICOM wording in this area.

Good luck,
Lance Lee, KD6DMR
Sunnyvale, CA

6859. Re: Kenwood 850S Opinions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-28 19:46:10 UTC
From: hduff@humnet.westonia.com
Message-ID: <7580301498901@humnet.westonia.com>
Source record: 221629

I owned a TS-850SAT since the day it became available locally.
I recently made the mistake of selling it to get a TS-690 (because
I just HAD TO have an HF plus 6 meters rig all of a sudden).
I was warned by friends at 2 of the local Ham stores that I would be
disappointed by the noticeable lower of performance of the receiver...
Sure enough the TS-690 is a nice radio and the 50 Khz to 60 Mhz coverage
is neat but it just didn't compare to the ol' 850.
I ended up selling the TS-50 from the car, putting the 690 in and buying
another TS-850 for the house. I have never operated a quieter receiver.
The noise floor is WAY down and the signals up.
The value of price versus performance cannot be beat IMO. I'd put my 850
up against ANY radio on the market sans a couple of the high end units
that have built-in DSP. Anything in its class can't even come close. Slope
tuning, notch filtering, 2 noise blankers and exceptionally high dynamic
range put the receiver at the top. I personally also like the built-in
MEMORY keyer for CW as well as the rear mounted IF port for driving
a transverter. One cool point about running transverters is that the
display can be programmed to display the actual operating frequency
ie.. 50.0, 144.0, 432.0 Mhz... no more mentally adding the local
oscillator offset to the display frequency to know where you really are
when running a transverter. This is done via the so called Menu system
of which there are many user configurable settings for a lot of the
rig's functions. Oh yes, you can't beat the combination of this rig plus
a transverter for all-mode VHF or UHF work. The performance of the
receiver will still meet or exceed the performance of any all-mode
V/UHF rig on the market.
I have but 1 wish of this rig...that is a built-in power supply. Not a big
deal however.
As you might gather, I highly recommend this radio. You WON'T regret the
purchase.

Message-ID: <3dsfpp$sbl@vixen.cso.uiuc.edu>
Source record: 221641

I'm looking for the mods to the Yaesu FT2200 mobile. I've checked
the mod archive at oakland but both files have the same mod (one) to
enable AM receive. This is one of the mods I would like to make, but
the mod listed in the archive is a disassemble and remove jumper type.
I get the impression from the latest issue of QST (in which mobiles were
reviewed that this is a "standard" feature, i.e. that it can be enabled
with a keystroke sequence. The mod in oakland dates back to fall 93
and I purchased my radio in late spring 94.

Can anyone help me here, or point to somewhere I can obtain a more
current version of the mods?

Thanks.

: >that the SWR must be no higher that 1.3:1 to be "acceptable".

How about this explanation. Acceptable performance to some
people means no observable degradation. A 1.3 to 1 SWR degrading
performance is a possibility if there is protective foldback
circuitry.

It could be that the amplifier may not meet all the
advertised specifications if the SWR isn't acceptable.
Fights between marketing and engineering happen all the
time :-). Marketing, of course, would like to advertise
the "best case" performance.

: I believe this is a case of tech writer failure, not amplifier
: design failure. Knowing the likely usage of this amplifier, no
: designer is going to require a 1.3:1 or better match or risk
: final destruction. If there is any validity to this recomendation
: at all, it's likely to do with the *receiving* helical filters.
: A high SWR can degrade the frequency response of the filters.
: Since most amps don't even *have* filters, a degraded response
: here is likely still better than the performance you'd get from
: other amplifiers.

Actually, the frequency response of a 2 meter helical bandpass
filter doesn't shift all that much as you vary the tap point or
the impedance. The *psychological* degradation of the operator
is likely to occur much sooner! I wouldn't worry much about the
filter degrading.

BTW, I published a collection of VHF filter designs in the 20th
Eastern States VHF/UHF conference proceedings, should you be
interesting in building your own.

Source record: 221626

The Radio Shack/Icom-designed HTX-202 is a solid performer, and is also solidly built.

Make sure your DTMF codes can "hit" your local repeater (some have complained that the DTMF audio level needed adjustment), and that you receive good signal reports when you should be.

Build a J-Pole, fire away, and enjoy. I usually recommend extended service warranties when I think of them on an "annual" basis. . . like the 27" TV I just bought: for ten bucks a year, the serviceperson comes to me, rather than me cart the unit to a shop - and parts AND labor are covered for the same price. THAT, to me, is worth it.

BETTER than give Tandy your extended warranty bucks, become a Member of the ARRL for $21.00, and sign up for their Ham Equipment Insurance. A buck-and-a-half per 100.00 CURRENT DAY replacement cost, I believe. A good deal, indeed. Covers your computer, too - if used in the ham shack.

From: fedpress@omnifest.uwm.edu
Message-ID: <3dsqth$ec@omnifest.uwm.edu>
Source record: 221623

I's like to know if there are any mods for the IC-551 6M all-mode xcvr. Also, I'd like to hear people's comments on the importance of polarity in 6M antennas. So far, the comments have ranged from "critically important" to "so what". The 6M scene here in Milwaukee, WI seems to be pretty evenly split between SSB and FM. The only VHF antenna I currently have up is an Icom discone.

If your serial number is 603XXX or higher, that is all you will get. The TH-79A that I have posted is 602XXX and I had called Kenwood earlier when we modified another TH-79A and found out about the change Kenwood had made. So, when I ordered my TH-79A, I asked for the lower serial number and my radio modified 400-511Mhz. There is nothing wrong with your HT, just hit by a mod by Kenwood.

Ip>
Ip> < $400
Ip> How's that?
Ip> =paul=

$400 is too much. That approaches the ballpark price range of one of the
I/K/Y big three.
How about all that for $350. Keep things in line with their HTX-202
whick is very competitively priced.

I'd like to see Radio Shack contract Uniden to produce a 6 meter
all-mode radio...something similar to the HR2510 or 2600 but nothing
like the limted HTX-100 10 meter rigs.
50 to 54 Mhz, FM/CW/USB/LSB (maybe even AM !?) with 25 to 50 watts of
output, DTMF microphone, MEMORY CHANNELS and programmable repeater
split. I'm really surprised that Uniden hasn't brought one out yet.
All Hams are allowed to operate on 6 meters but there's a lack of
affordable equipment. The cheapest all-mode 6 meter radio is the Yaesu
FT-690r at over $700.
If they can make a 10 meter all-mode and sell them for $300, a 6 meter
radio wouldn't require much further engineering.. under $400 would be
accceptable ! I guess they had full intention of producing the 2510
knowing that they would sell as many or more to the CBers as they would
to Hams...maybe a 6 meter radio wouldn't be successful for them !?

Just my 2 cents worth !

>it to mine. I'd be happy to reimburse you for your time.

The wiring diagram that I have for the D104 shows the wiring for the switching function only... I found a 1 watt audio amp kit at Radio Shack for $10... (cat # 28-4031) I haven't put it together yet but I think that it'll do the trick... it requires 4 to 18 VDC power and will provide either 26 dB or 46 dB gain. The circuit board is small enough to mount under the non-amplified base and with the right PTT switch you should be able to switch the power on and off to save the battery...

Good Luck....

Clint Bradford (clint.bradford@ectech.com) wrote:
: The Radio Shack/Icom-designed HTX-202 is a solid performer, and is also
: solidly built.

The ICOM connection to the HTX-202 is a MYTH!!! The radio is built by Maxon, in Korea, and was designed by them from Radio Shack specs. The ICOM legend came about because it looks like an ICOM and it uses the same speaker mike and battery packs as the older ICOM's. However it is a good performer for the money. I can't quite agree with the well built as both of mine have been in for service, one twice (yes, I have the service plans).

: Make sure your DTMF codes can "hit" your local repeater (some have
: complained that the DTMF audio level needed adjustment), and that you
: receive good signal reports when you should be.

There is an autoreply option. Many repeaters will not work properly with the radio when used for autopatch calls with the option OFF, make sure autoreply is ON.

: Build a J-Pole, fire away, and enjoy. I usually recommend extended
: service warranties when I think of them on an "annual" basis. . .
: like the 27" TV I just bought: for ten bucks a year, the serviceperson
: comes to me, rather than me cart the unit to a shop - and parts AND
: labor are covered for the same price. THAT, to me, is worth it.

Radio Shack has a flat rate policy for labor. It just happens to be the cost of the service plan :-) You loose the first time you fix the rig (for the cost of the parts).

: BETTER than give Tandy your extended warranty bucks, become a Member of
: the ARRL for $21.00, and sign up for their Ham Equipment Insurance. A
: buck-and-a-half per 100.00 CURRENT DAY replacement cost, I believe. A
: good deal, indeed. Covers your computer, too - if used in the ham shack.

I like this advice, but I don't think the insurance covers repairs.

I've had the Scout for a year now and enjoyed it tremendously. No complaints at all. I've only had one problem with the radio itself and with one of the band modules. In both cases, the service department promptly and courteously took care of the problems, under warranty!!

The PTO was starting to "flutter" on audio so I had it repaired under the 1 year warranty. One of the band modules died and they shipped a new one out to me for exchange the next day.

I get the feeling Ten-Tec is still a small enough company where they can dispense personal service to their customers regarding product issues and are technically sound (very knowledgeable) with respect to their business.

I plan to hold onto this rig for many years and its clearly the most affordable hf rig on the market today!!

If you have a manual, follow the Yaesu directions.
That is, Transmit audio should be connected with a series
0.1 uF capacitor to the mike plug tip.
PTT should be connected with a series 2.2K ohm resistor
also to the mike plug tip.
Ground the plug sleeve.
Audio from the HTX 202 is taken from the external speaker
jack.
By using this arrangement, it is not necessary to enable
the isolation circuit.

Source record: 221642

I have the following dual band HT package for sale.

* Alinco DJ-580T dual band (2 meters & 70 cm). Specifications
are as follows.
* 5 watts output
* 20 memeories per band
* Cross band repeat
* messaging and paging functions
* Tone encode and decode
* multiple scan modes
* RX 110.000 - 173.995 & 420.000 - 479.995
also recieves 800 MHZ cellular (but its not legal)
* TX 144.000 - 147.995 & 440.000 - 449.995
* Auto power off & battery save
* Call channel on each band
* 3 autodial memories
* and more
This comes with the standard rubber duck and 700 MAH battery
and trickle charger.

* Qty (2) 1200 MAH batterys
* Remote control speaker mike
* Mike (to clip on shirt), earphone and vox control

The radio is Approx. 15 or 16 months old. I have all manuals,
boxes and receipts for all of the equipment.

I am asking $450.00 for the package. If interested please
respond to N3PSJ@N3ACL.EPA.USA.NA (packet) or KENN3PSJ@AOL.COM
(Internet) or call (215)361-3065 between 9 AM and 9 PM Eastern
time. Ask for Ken.

I think you will be very happy with it. I sold a TS50
and bought one. Vy nice receiver and for mobil use the
noise blanker works much better than the TS50 for removing
my ignition noise. I mount the detachable faceplate in
front of the steering wheel clipped on to the dashboard.
I can rotate the VFO with a finger while steering. Much
easier controls (TS50 has ridiculous menu scheme) and with
the faceplate on the radio, it is a comfortable desktop
model. Nice large numerals too. Go for it.

I haven't looked into this much, but I should, since I my 432 antennas
100feet away from the shack can hear my 486 computer quite well.

What about threading your cables through toroids or using
split ring material for clamping over the cables.

There are also flat pieces of ferrite for clampling on flat
cable that I've seen too.

If you fix it, let us know how you did it.

^^^^^^^^^^^^^^^^^^^^^^^^^ Pete, why would you need this for a kit? :-)
|>
|> I also like the S.& S. Electronics kits very-very much.

I might add that the Oak Hills Research Series of Kits, especially the
new Explorer Single-Band CW Xcvr with it's almost Heathkit like instructions
shows that the free market will fill a void where some else gave up or over
priced themselves out of the market. I spent a lot of time and money on
Heath and was very disappointed towards the end when the cost of a kit
rivaled the price of a factor assembled unit. I still bought Heathkit
just to have the joy of working on one.

I still have a SB-104A unassembled in the box that I'm saving for retirement.
:-)

Other kit manufacturers have come and gone and only those with quality and
support will remain for any period of time. The customer's memory is very
good.

ARRL Bulletin 84 ARLB084
>From ARRL Headquarters
Newington CT October 25, 1994
To all radio amateurs

SB QST ARL ARLB084
ARLB084 FCC licensing changes

The FCC today released a 7-page Order amending its amateur rules,
effective December 20, 1994, to reflect what the Commission calls
''nonsubstantive procedural changes'':

1. To permit electronically filed data from VECs (paper
applications also will still be accepted);

2. To authorize operation as soon as the new license data appears
in the amateur service licensee data base, rather than (as now) when
the license document has been delivered (details of how the new
licensee can determine his call sign will be announced later);

3. To add a new rules section, ''Examinee Conduct,'' to emphasize that
an examinee must comply with the instructions given by the
administering VEs;

4. To treat ''Technician Plus'' as a license class;

5. And to provide for a ''renewal short form'' which the FCC says
will be mailed to licensees in advance of their expiration date
beginning sometime in 1995. The FCC added that renewal applications
would be accepted no more than 90 days before the expiration date.

Because of the nature of these rule amendments, there is no notice
or comment period required by federal law. Again, these changes do
not take effect until December 20, 1994.

Not according to FCC employees here in Honolulu. According to an FCC source here, as long as the call is issued you're okay to be on the air. Yes, I understand that part 97 specifies that one has to have his/her license "on your person when operating." This might also be okay here because of the small community of hams here on Oahu.

o10022@a81.corp.mot.com wrote:
: Yesterday I bought a Radio Shack 19-1122 2 meter amp, and promptly
: returned it. Here's why:

: I'd checked the spec sheet at the store, and what I saw looked good
: (as far as it went). When I got it home, I read the entire short
: owner's manual, before I even took the equipment from the box.

: The manual at one point says that a high SWH can damage the
: equipment, and there's no surprise there. Then, on page 12, it says
: that the SWR must be no higher that 1.3:1 to be "acceptable".

: Since the antenna system not uncommonly results in a SWR of perhaps
: 2:1 as one transmits at various frequencies within the band, that
: would exceed the "acceptable" level mentioned in the manual. (Yes, I
: know most antenna manufacturers claim 1.5:1 or better across the full
: band, but I believe in Murphy's Law much more than in advertising
: claims, and even 1.5:1 would exceed the "acceptable" max of 1.3:1.)

: The clerk as R.S. could not tell me whether the "1.3:1" was a genuine
: "maximum" for the amp, as was implied in my reading of the words, or
: was merely a "recommendation", or whether reliability/performance
: begins to suffer at even slightly higher SWR's. (At least I was
: fortunate enough to find a salesperson who knew what SWR is!).

: Have any of you good readers any information which might lead me to
: believe that the quoted "1.3:1" is excessively conservative? Or,
: have you recommendations for other modest-cost amps, such as the
: frConcepts model rfc-2-23?

Well, I'm borrowing one now, and I can verify that it will work
quite happily with a 3:1+ SWR. I found that out after high winds blew
my antenna down, and I noticed an excessive number of retries on
packet... the amp was running a TCP node for at least a day, probably
more, into the high SWR. BTW - it put out about 10 watts into the
3:1 SWR.

Personally, I think it's a great little amp. I can hear nodes that
I was never able to get before, and get 31 watts out from 2 watts in,
in continuous operation.

- Rich

The VEs at my wife's testing session told her to retain the original or a
copy of the CSCE as proof she passed the test, while she used her new
callsing and waited for her license. It turned out to not be that big a
deal, as her license arrived 4 days after she called in for her callsign.

The December 20, 1994 revision of Part 97 (section 97.9) no longer
mentions the bit about having it in your personal possession while
operating. This version of Part 97 is available online from the
following sources:

1) WorldWide Web: http://www.cc.columbia.edu/~fuat/cuarc/Part-97.html
2) ARRL info server (filename = PART97.TXT)
3) (soon to be updated) oak.oakland.edu ftp mirror of ARRL info server
in pub/hamradio/arrl/rib (I think).

adams@chuck.dallas.sgi.com (chuck adams) writes:

My experience with Ramset kits have forever turned me off of ever buying any of thier junk again. I bought an FTR-146 (2 meter transceiver) to use as a packet radio. I was missing 4 components, which they sent me. The real problem was that I could never get more than 2 watts out of the radio. This was with a Motorola 2000 Communucations Monitor sitting next to me, borrowed from a friend. I talked to the Ramsey salesperson at the Atlanta Hamfest. He told me that "oh yea, send it in, and we'll tune it up for you. Should be about $10." Well, that sounded real good to me. I later checked with the home office when I was ready to ship it off, and the tune had changed. "Oh, there's no charge if the kit is built correctly, but if it isn't and we have to fix it, it'll be $50.00". Okay. I had been over the damn thing about 20 times, and I knew it was built right. So off it goes in UPS. 4 weeks later (and about 6 phone calls), it's ready. These idiots want to charge me $50.00. "Why?", I ask. "Well, we had to squeeze the coils." "But that doesn't constitute not built correctly.", says I. "Oh, it does, because it wasn't built right, since we had to adjust the coils".

Well, if it wasn't for the fact that I spend $150 (or whatever the going price for the kit was), I would have told them what to do with it. As it was, I paid the the exorted $50 (plus shipping), and have a radio that makes a nice spur emitter.

Never ever ever ever buy Ramsey junk.

Is anyone else out there running the DRSI PC packet adapter with the AA4RE BBS program. We FINALLY got it to run (damn lousy documentation) but were wondering if anyone out there has experience with this setup and can offer some help/hints/tips/traps/etc.

For the record, the DRSI setup is being run on an 8088 Commodore PC-10 with an ancient CMI 20 meg harddisk. It will be (obviously) moved to a better system, but first we want to get the 'bugs' out.

Thanks in advance for any information you may be able to provide...

6913. Re: FT-51R or FT-530?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-30 04:03:12 UTC
From: mbrenner@csulb.edu
Message-ID: <3e00q0$g07@garuda.csulb.edu>
Source record: 221690

I have the flyer for the FT-51R
RX is quoted 110-180 + AM(Aircraft)
420-470

differences seem to be in that 51R is alpha numeric with operating help
in the displays. Also you can see 8 memory channel signal levels
"specrascope". The unit appears smaller and has only one knob on top.
You get 80 Alpha memories (120 if only using mem numbers) and the thing will
display incoming DTMF characters (I guess like the kenwood stuff).

It seems that all of the other stuff is the same as the 530 (features) it
does not use the same batteries but does use that cool display mic.

I don't know the cost but all of the compeditive units have not cost more
that units that they have replaced so I suspect that the List price is
the same as a 530 (if 530 is discontinued they may have deals on it though).

There are also other new features like cloning, Smart Mute, and 5 poewr
levels. On the 51R. Oh yea you get some more output power from a lower
voltage battery (9.6v for 5W)

6914. Yaesu FT5100 Data In/Out Audio Level

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-30 04:41:18 UTC
From: mothomas@aol.com
Message-ID: <3e031e$k46@newsbf02.news.aol.com>
Source record: 221693

The manual for the Yaesu FT5100 Dual Band Mobile rig indicates the audio output level of the DATA IN/OUT port is about 400 mvRMS. I find mine is on the order of about 100 mvRMS for packet signals. This level is too low for effective packet operation (using a KPC-3), especially if the packet signal is not deviated sufficiently.

Has anyone else experienced this problem ? Any suggestions ?

And... no there are no adjustments that I can find to modify the audio output level of the radio or input level of the KPC.

Thanks for reading.

: --------End of Part 97 quotation -------

This is true, and would still be true if there was a clear and
unmistakable law making out-of-band ham gear illegal.
This rule also covers non-amateurs for the exact same purpose (although
I dont have my Fedral Code of Regulation handy to quote)
The issue is: Can I make the "means" available at all times, on my belt,
just in case?
Could we extend the reasoning to firearms?
After all, I can defend myself with whatever means available, if life
or limb were in immediate danger.

The short, unsupported, answer from the FCC field office here in Detroit
is "modified amateur gear is illegal and will be seized" (yes -I- called)

Im under the impression its a type acceptance thing that goes like this:
When an amateur HT is modified for out-of-band TX, it then falls
under commercial guidelines.
Commercial HT's must not be front panel programable, or vfo controlled.

Im not sure how older vfo controlled tranceivers get around this
as most over shoot the band and hence "comit the same crime" :-)

WARNING: the following text is my opinion, take it or leave it

Personally, I wish there was a clear law against it, as for every
person I've met with a legitimate "need" for this type of mod, I've
met at least 20 who just want to screw around.
I think its an extention of that syndrom that makes some hams buy
ex-police cars, outfit them with yellow lights, and overestimate
their importance in the greater scheme of things. Just look around
at the next RACES or CB patrol meeting, the guy wearing the police style
jacket will be driving that car, and Ill guarantee his HT goes OOB.
But then, he "needs" it, might see a 10-100 in progress and need
backup.

Well, sorta. They're *not* rare antiques, which is what the original poster was asking about. Unless you chance upon one of those people that PT Barnum loved so well, Ranger II prices range from about $100 to about $175 depending, of course, on condition. Although they're not exactly rock stable on 20m and up,
they're pretty good low band cw rigs.

[snippety-snip]

And here (I think :-) are the relevant sections from the most recent Part 97
that I have available .....

PART 97--AMATEUR RADIO SERVICE
(current as of December 20, 1994)

[large chunk omitted to save bandwidth]

S 97.5 Station license required.
(a) The person having physical control of the station apparatus must
have been granted a station license of the type listed in paragraph (b), or
hold an unexpired document of the type listed in paragraph (c), before the
station may transmit on any amateur service frequency from any place that is:
(1) Within 50 km of the Earth's surface and at a place where the
amateur service is regulated by the FCC;
(2) Within 50 km of the Earth's surface and aboard any vessel or craft
that is documented or registered in the United States; or
(3) More than 50 km above the Earth's surface aboard any craft that is
documented or registered in the United States.

[more deleted]

S 97.9 Operator license.
(a) The classes of amateur operator licenses are: Novice, Technician,
Technician Plus (until such licenses expire, a Technician Class license
granted before February 14, 1991, is considered a Technician Plus Class
license), General, Advanced, and Amateur Extra. A person who has been
granted an operator license is authorized to be the control operator of an
amateur station with the privileges of the operator class specified on the
license.
(b) A person who has been granted an operator license of Novice,
Technician, Technician Plus, General, or Advanced class and who has
properly submitted to the administering VEs an application document, FCC
Form 610, for an operator license of a higher class, and who holds a CSCE
indicating that the person has completed the necessary examinations within

the previous 365 days, is authorized to exercise the rights and privileges of the higher operator class until final disposition of the application or until 365 days following the passing of the examination, whichever comes first.

[rest not relevant in this context]

The reader will note that the emphasis is on *granted*, not 'possession'; all you need to do is convince the FCC enquiry staff to tell you that your request has been granted, and what callsign was issued as a result. Of course, that may not be as easy as it sounds :-)

How's that? I'll tell you, its BS! Radio Shack has NO PLANS for an all-
mode 2 meter mobile! In fact they have no plans to expand their amateur
rig selection until late '95 (if at all next year.) They *might* produce a
Maxon 2 meter FM mobile late in '95. That's it, no all-mode, no
dual-banders,
no HF stuff at all (bummer!) As most of you probably know Radio Shack
is not really known for pioneering much of anything. They wait to see how
it does in the market and then (perhaps a year late) come out with
something.
Look in their catalog, they still have a "Disco Mixer!" (...not meaning to
trash Radio Shack, they have lots of neat and fun stuff...)

I have a TS450SAT, and I assume the same advice applies. Do you
mean the putting a 250Hz on the first IF and 2.1Khz on the second IF?.
That doesn't make sense to me. I would think one would put the
more narrow filter after the wider one.

Another question, do IF filters improve a receiver's dynamic range?
I liked Gary's advice about _strong_ receivers a few days ago.
Being an avid CW person, would it make sense to put a 250Hz on the
first and second IF's?

: Does anyone have any insight to the quality of the radio kits
: produced by Ramsey (sp?) Electronics? Has anyone here built one?
: Any comments appreciated, any comments mail to me at
: mourning@raven.cybercom.com, doubly so. Thank you!

Actually, Ramsey kits are known for generating spurious emissions,
even when constructed according to the directions. I believe the author
of the previously-mentioned 73 article had that problem, as have
several posters on the net. Basically, if you're not aware of it,
you could end up operating an illegal transmitter unless you check the
output on a spectrum analyzer. I've seen, used, and constructed
Ramsey kits, and was unimpressed at the quality and performance.
You are MUCH better off getting a kit from Oak Hills Research if you're
interested in HF. They cost more, but are definately worth it.

To prepare for the exams you will need some study material
and more information about classes, examination points
(the exams are given by volunteer Hams in your community),
and clubs in your area. A number of organizations will be
more than willing to help. One such organization is the
American Radio Relay League. Write them at:

ARRL
225 Main Street
Newington, CT 06111

or call them at 1-800-32NEWHAM.

Ask for their "newcomers" package. It will include more
detailed information, a list of classes and clubs in your
area, and a list of scheduled examinations in your area
also.

If you are near a Radio Shack store, go there and ask for
a book entitled "Now You're Talking". This book is also
available from the ARRL. It contains all the information
you need, including study material and sample questions
for the examinations for Novice and Technician licenses.

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I have a Heath SA-2060A antenna tuner that's got a busted-up "small"
insulator. It carries one of the signals from the tuner itself to the
metering circuits, located in an adjacent box which attaches to the tuner.

Here are the specs:

Roughly 1" long.
Passthrough conductor (screw-threaded) about 1/8" in diameter.
Size of hole it's going through is 1/2" (no, I prefer NOT to enlarge it)

I believe it's Heath part no. 71-2 and NOBODY in the free world seems to
have one. In its stead, I will settle for an equivalent - ANY equivalent,
in order to get this glorious device working again...

Ceramic, plastic, whatever...it's a 3 kW tuner, so there are some pretty
high voltages (potentially hi hi hi) in there. PLEASE help me - my cats
are going to destroy it unless I get it put back together.

|>met at least 20 who just want to screw around.
|>I think its an extention of that syndrom that makes some hams buy
|>ex-police cars, outfit them with yellow lights, and overestimate
|>their importance in the greater scheme of things. Just look around
|>at the next RACES or CB patrol meeting, the guy wearing the police style
|>jacket will be driving that car, and Ill guarantee his HT goes OOB.
|>But then, he "needs" it, might see a 10-100 in progress and need
|>backup.

Using that logic on your car example says that cars should be limited to
65 miles/hour maximum speed, and that ex-police cars should be illegal
to own. Also that same logic can extend to butter knives. Since they
too can be used illegally for the purpose of assaulting someone, they
should be illegal to own. After all, your fingers will butter your toast
just as well as a butter knive. ;-)

Possession laws are just plain wrong (IMHO). They tend to be passed to
make enforcement easier, i.e. probable cause and all that rot. Can
you show that possession laws have any deterent effect that can't be
achieved with use laws alone?

Finally using your cop-wanna-be example. Yes, my RACES group has a
cop-wanna-be complete with the uniform (his security guards uniform),
flashing lights, fancy sports car, police style belt, etc. So because
of the potential actions of one individual, I should be prohibited from
possessing something that might be able to be used to commit a crime? *NOT*

From: N0ZOZ
Message-ID: <3e1ijr$mun@golf.ustores.missouri.edu>
Source record: 221557

Hi, I'm looking for 2 TNC Cables...

1. TNC (9-pin) to Kenwood TH-79 HT. The HT accepts
a 3/32" RX cable an a 1/8" TX cable.

2. TNC (9-pin) to Alinco DR-130 mobile rig. The Alinco
accepts a standard 8-pin mic connection.

If anyone can help me with either of these, I'd very much
appreciate it! Please e-mail me at c600322@mizzou1.missouri.edu
and not to this newsgroup. Thanks!

>PTT should be connected with a series 2.2K ohm resistor
>also to the mike plug tip.
>Ground the plug sleeve.
>Audio from the HTX 202 is taken from the external speaker
>jack.

Here's another way that works with RS/Icom/Yaesu "leaky PTT"
HTs, and has a faster TR turnaround than the resistor/capacitor
circuit.

TNC Radio
600:600 interstage xfrmr
PTT--------))))))))-------------> Mic tip
=========
TXA--------))))))))----------x--> ear shell
|
GND--------------------------x

RXA-----------------------------< ear tip

The transformer can be any grab bag interstage transformer, a tiny
one you heatshrink into the cable will work.

The reason this circuit improves TR time is that it eliminates the
RC time constant of the capacitor/leak resistor of the other method.
This circuit speeds up the TR time on a Icom 2AT by more than half.

6933. LOOKING FOR A DEAD ICOM IC-505

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-30 19:53:02 UTC
From: pouelle@uoft02.utoledo.edu
Message-ID: <D1n38E.CHy@utnetw.utoledo.edu>
Source record: 221559

Hello all,
I am looking for a dead IC-505 to use for replacment mechanical parts.
I have a sort of working unit. The previous owner removed the defective
10W amp transistor and the metal bar that connects the two switches inside
that switches the amp in and out. The bar is long gone and ICOM doesn't
even have a part number for it (but they were very patient and helpful on
the phone).

Rig works ok on low power (around 3 watts)

>I liked Gary's advice about _strong_ receivers a few days ago.
>Being an avid CW person, would it make sense to put a 250Hz on the
>first and second IF's?

Receiver dynamic range is usually determined before the first IF filter. Either the RF amp or the first mixer will crunch before the IF will crunch. So narrow filters usually don't affect dynamic range. If the receiver has an unusually good RF stage, a strong mixer, a clean first LO, and a strong post mixer amplifier, then the first IF filter will help keep *adjacent* channel strong signals from driving the AGC to limit dynamic range. Of course it makes no difference for on channel signals. A second IF filter almost never makes a difference to dynamic range. Primarily it's a tail filter to remove internally generated IF noise, and to catch residual blowby of the first IF filter's skirts.

Of course all this may vary depending on the particular gain distribution and design of the receiver in question. Cascading two narrow filters will help skirt rejection, and reduce internal noise to some extent. Those are both worthwhile things. However, two cascaded narrow filters will ring more than one, and this can be a problem for fast CW copy, or for data. If the radio has passband tuning, using two moderate bandwidth filters, and sliding them against each other, can reduce ringing while giving about the same passband characteristic as a single narrow filter.

Note, even this latter method isn't cast in stone. If it were easy, every amateur receiver would be a great one.

Who cares if you are using the old or the new question pools? The
important thing is the INFORMATION that is to be tested. This doesn't
change all that much. When I last tested last year, I used a 5-6 year
old ARRL book. The questions were out of date. I still passed
because the material is roughly still the same.

6936. Alinco DJ580 question..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-12-30 21:46:11 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <1709CEBD3S86.WALLY@ukcc.uky.edu>
Source record: 221566

Been playing with my spiffy DJ580 (on PL lock.. *sigh*) and found an undocumented feature, and curious if anyone knows what it is.. It very well could be in the manual, but I haven't seen it..

On FL lock, pressing FUCT F prints FD/On or FD/Of.. Haven't been about to see any difference, can't guess what FD could be either.. Probably something obvious, but anyway...

Also, just curious about something... I suspect they've updated the radio since the manual was written, as quite a few functions are documented as requiring to be held down for approximately a second (such as the SCN button to scan), but actually starts scanning with a quick press.. I prefer this, obviously, but just curious about it.. :)

Also, does anyone know if the antenna is fragile? I've noticed it's pretty 'soft,' just curious if it could be easily damaged. (I'm wondering if it's a pretty tight coil, rather than the larger wider spaced rubber duckies I'm used to on scanners..)

Thanks..

I have a TS-530S whose frequency drifts upwards and reacts to whacking the case, table top, or whatever by bouncing around freq. wise - UNTIL YOU HIT THE SEND/REC switch and release it. After this, it's petty much solid.

Can anyone explain the nature of this problem? Actually tapping the relay itself didn't seem to do anything. It's a VCO with a PLL, for starters.

This enerally happens only upon start-up.o

I've got a big problem...

The UHF side of my Kenwood TH78A will not transmit sub-audible tones (PL), touchtones, or any sounds from the mic. The VHF side will, without any problems. When I do key up on the UHF side, it opens up my other handheld's carrier squelch, but otherwise, that sucker is dead...

Any similiar problems and solutions that you've had, please e-mail back!

Thanks!

It's documented in my manual...it enables/disables full-duplex operation
so that you can carry on a conversation on simplex freqs on both bands
(i.e. you talk on 2M and listen on 440 and your buddy talks on 440 and
listens on 2M) in telephone fashion -- no release-to-listen between
exchanges.

Hope this helps....

Message-ID: <1994Dec30.232320.14690@wb3ffv.ampr.org>
Source record: 221574

My only hands-on experience with Ramsey: A friend had trouble getting his Ramsey 40M QRP rig to work. I fixed some wiring errors he made, got it going, then checked it on two different (and expensive) service monitors for harmonic suppression; I got an unsettling figure on both, identical at 20 dB down for the second harmonic (hint: at QRP levels, under 5 watts, FCC requires at least 30 dB); later tests on a Hewlett Packard spectrum analyzer (very expensive) confirmed the 20 dB figure. All the parts (all three of them!) in the harmonic filter were in the proper place and of the proper values according to the manual. The fix was simple enough--I went to the ARRL handbook filter tables, whipped up something which gave me a nominal 30 dB attenuation of the second harmonic, and then wired that in series with the existing filter; it cost me 0.2 dB insertion loss, a modest amount, but now the rig has about 50 dB of second harmonic attenuation according to Messrs. Hewlett and Packard. I decline to make any comments on the record about the design of the harmonic filter in the Ramsey 40M QRP rig :-) 73 de WA8MCQ

Sean's reply is just about what I was thinking when I got yelled at by that 6 lander that wanted to put a SAR channel in his radio to call for help when he went hiking and carried the channel, just in case.

My question to that gentleman is, would he have purchased a portable radio like a HT220 back in 1976 and crystalled it up for the SAR channel and carried it when hiking, just in case?

Sean's reasoning is dead on about the purchasing of retired squad cars and the yellow lights and such. Many hams have overrated and overloaded egos that say they can do anything, anytime because they are hams and have the technology that others don't. It is all just a case of egos run wild and modifications are just another way to feel important. I think it will be found that the majority of those looking for mods are ham licensed within the last five or six years. While I have nothing but my suspecions to base this on, I suspect this to be the case. (Flame away, I can take it.)

Actually in all honesty, hams are becoming more and more irrelevant. Due to the number of cellular phones on the streets, helping someone along the road with a 2 meter rig and a repeater/autopatch almost does not happen anymore. If a breakdown does not have a phone themselves, a passerby almost certainly will have. Just think what will happen when the PCS system gets up and running. People will have individual phone numbers. That will about put hams out of business except for MAJOR natural disasters that can and will cripple commercial networks and for operations in areas not served by such systems. Even then, redundency built into some networks will still continure to serve the public.

We really need to take a good long look at ourselves and honestly evaluate our place in the community once again.

By the way, I am not a "hamster cop". I don't care who listens to what.
I do not agree with the ECPA and it should be repealed as a piece of bullshit legislation. Maybe the Republicans will be willing to help this along.

Kevin

What an argument! You refuse to buy a radio, designed and intended for
use on one or more ham bands, based on its not being able to work on
non-ham bands for eavesdropping purposes?

I would RATHER have a radio built to operate on its intended frequencies,
with enough filtering to keep the rest of the radio spectrum out! If
you want a scanner, then buy a scanner. If you absolutely MUST have one
that can cover the 800 MHz band, then go to Japan, buy a scanner and
bring it back with you. What that has to do with ham radio equipment is
lost on me...

You basically get what you pay for with Ramsey stuff. If you're an adventurous troubleshooter, fine. If not, don't bother.

The 2 meter synthesized rig was reviewed in QST, and according to them didn't meet the minimum FCC spurious radiation requirements. There's a hint of what's in store for you.

Greetings!

I have a Palomar 90A in great shape, w/manual and spare tubes.
Maximum output is about 200 watts on 10 meters average on
40 is about 175 watts...oh yea it is 10, 15, 20, and 40 meters.
Asking $200.00 shipped mainland USA OBO.

HOW TO ACCESS THE WB3FFV AMATEUR RADIO INTERNET BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there are plenty of other wares on-line). Through
user support I hope to keep the latest and greatest ham software on-line.
The BBS also offers access to nearly all of the Internet (USENET) NetNews
groups, plus access to most Internet services such as Email, FTP, TELNET,
Gopher, WWW, Callsign Lookup, Etc... Below is the information that is
needed in order to access the BBS via Telephone, Telnet, or FTP. Please
pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

410-661-2475 - 12/24/48/96/14.4/16.8/19.2/21.6/28.8
(V.32bis,V.32terbo,V.34,V.FC,HST,V.42bis)

410-661-2648 - 1200/2400/4800/9600/14400/23000
(MNP2-5, V.32bis, V.42bis, Turbo-PEP)

TELNET/FTP - wb3ffv1.sed.csc.com (20.2.1.80)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: UniBoard UNIX BBS Software (Version 1.30b)
Misc. Info: Machine is an Pentium-90/MP running UNIX System V Release 4.2
and features more than 4 Gigabytes of on-line file storage.
Most transfer protocols are available!! (5 phone lines)

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS]
WA7MBL BBS for the PC
W0RLI BBS for the PC
MSYS BBS for the PC running KISS TNC's
AA4RE BBS for the PC (plus BETA versions)
F6FBB BBS for the PC
```

G8BPQ PC-Node (Version 4.08)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /var/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic (ASCII Text)
-or-
uucp wb3ffv!~/FILES.Z /usr/spool/uucppublic (16-Bit Compressed)
-or-
uucp wb3ffv!~/FILES.gz /usr/spool/uucppublic (GNU Gzipped)

This will move a copy of my files listing into your uucppublic directory.

If you want to access the BBS via Telnet all you have to do is TELNET to wb3ffv1.sed.csc.com, and login is 'bbs' with no password required. To use anonymous FTP just ftp to wb3ffv1.sed.csc.com and login as 'anonymous'. This system is currently attached to the Internet via a dialup SLIP link, and should generally be available 24hrs, but at times the modem will drop the line. Also since this isn't the fastest link, I will be limiting the maximum number of anonymous sessions for the moment.

If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Internet : howardl@wb3ffv.ampr.org | Howard D. Leadmon
UUCP : wb3ffv!howardl | Advanced Business Solutions
PHONE : (410)-661-0447 | 4107 Martin Avenue
FAX : (410)-661-0644 | Baltimore, MD 21236

Well I guess I will be the guinea pig. I have one and have been feeding it into a 2:1 flat-lead j-pole. So far no problems (~ 1 mo) and good signal reports. I do run it on my 5/8 wave in the car which is 1.2:1 so I guess it gets a little break somtimes :-)

73's Dennis

I am about to buy my first radio, I have been looking at the
new YAESU FT51RH. Is this a good radio ???.

I want to do packet later, will it work or are there better radios.
I also like the paging feture

Source record: 221586

Hello,

as a proud shortwave listener I decided to ask my questions
regarding an amplifier in this newsgroup.
After one year of listening to my radio, I decided to
purchase a compact-disc player. Since I move quite often, I need
something small. Compact disc player is very small and hi-fi
too. The problem was to find a hi-fi amplifier in a corresponding
portable size.
Other option was to purchase speakers with built in amplifier,
but they dont feature hi-fi quality.
It was really surprising to me, that I found in stores
complete hi-fi sound systems smaller than smallest amplifier.
My questions are:
-do there exist small sized hi-fi amplifiers,
-is it meaningfull to expect hi-fi sound quality from relatively
small speakers,
-are there any speakers with built in amplifiers providing
hi-fi sound quality.

Please, if you have any advice concerning my questions, or know
about another information source accessible through Internet,
e-mail me.

I am sorry if my questions are bit off topic.

Good luck,

Alexander
